2-D Electrophoresis

Mouse liver

Limitations :

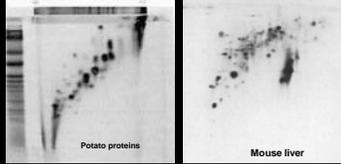

- Resolution
- Reproducibility
- Automation
- Quantitation
- Analysis of Proteins from 3 - 12
 - extreme acidic or basic pI
 - low abundance
 - integral membrane proteins

?

IPG Strips

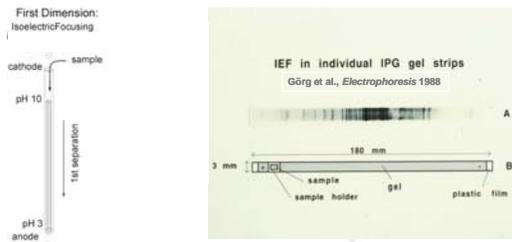

- pH gradient stability with time
- easy handling

IEF in tube gels

- mechanically fragile
- carrier ampholyte IEF
- pH gradient drift/ time-dependent

IPG Strips

- mechanically strong, plastic backing
- immobilized pH gradient
- Ready to use

Sample preparation

Critically important

- Cells (controlled conditions, synchronous etc.)
- Tissues (heterogeneity in composition)
- Organelles (method of preparation)
- Biological fluids (dynamic range 10^1 - 10^{10})
- Protein solubilization (urea, thiourea, detergents, reductant)
- Protein precipitation (Clean-up from lipids, polysaccharides, nucleic acids, salts)
- Sample integrity (protein degradation, PTM)

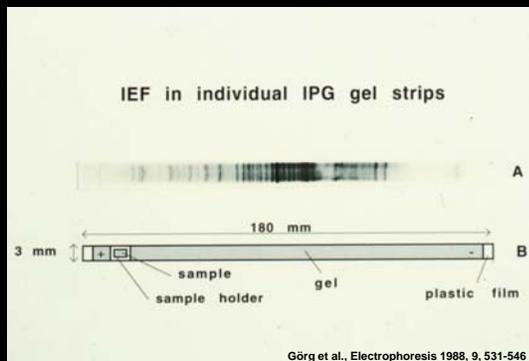

© Görg 2007

Sample degradation: Loss of high Mr proteins

Actual Protocol of IPG-Dalt

© Görg 2007

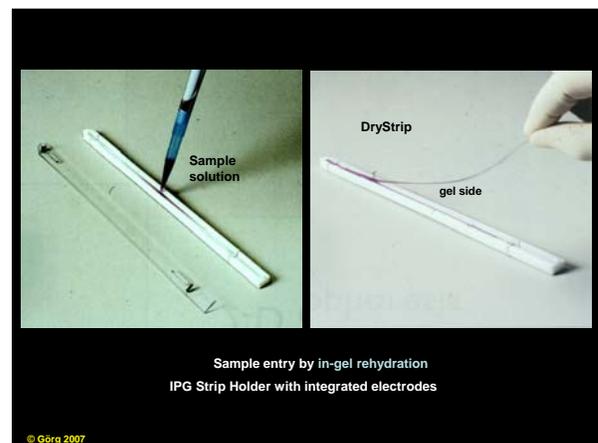

© Görg 2007

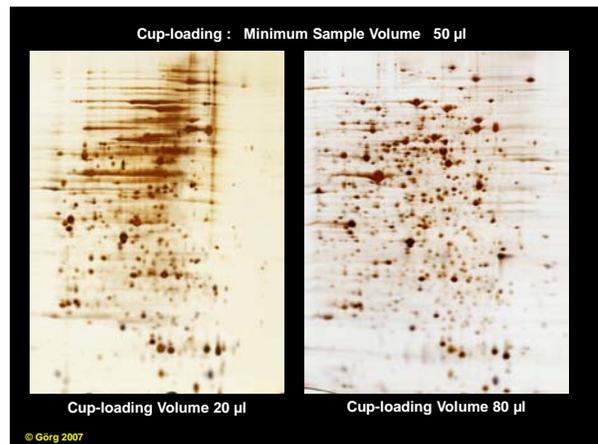

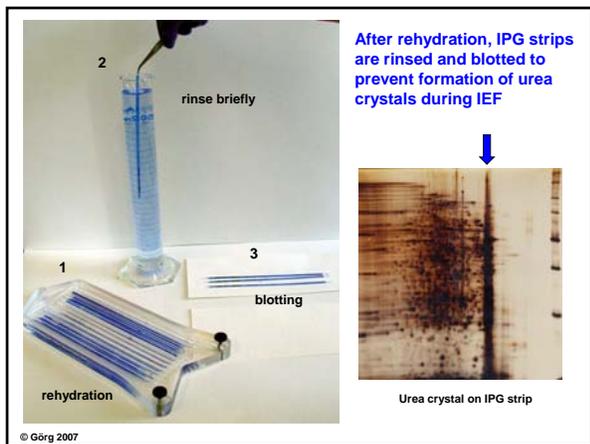

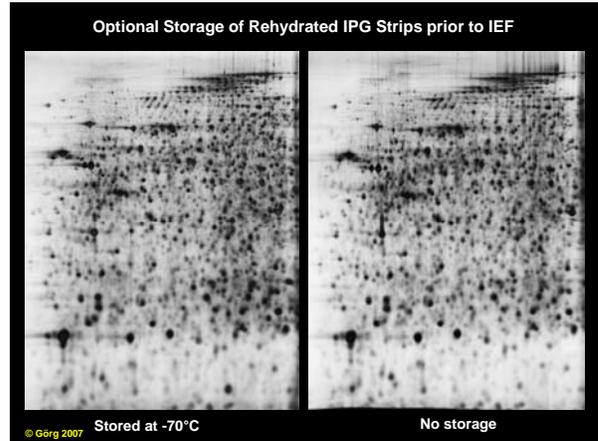

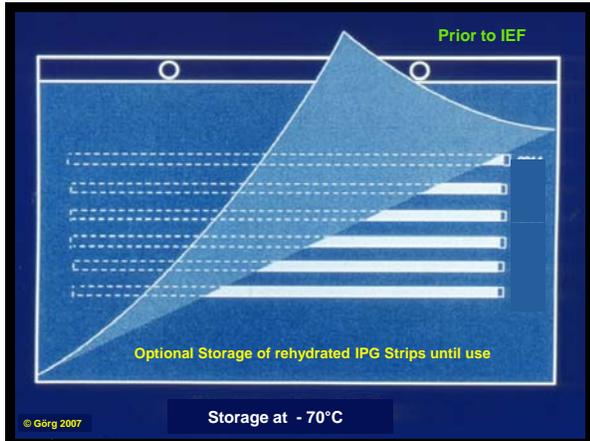

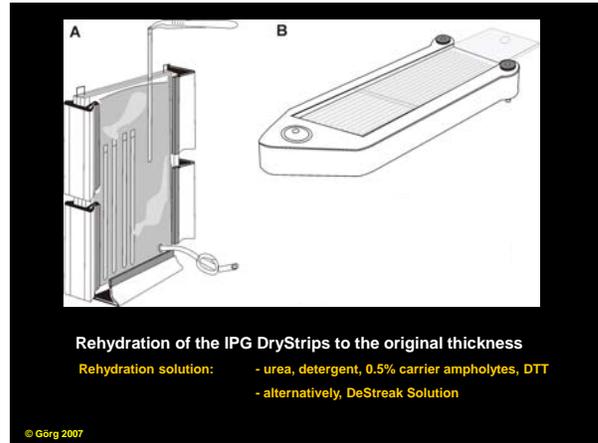

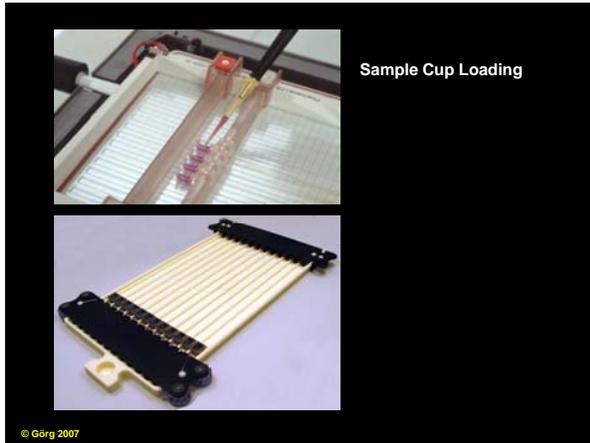

Sample application

- ★ **In-gel rehydration / Cup-Loading**
Analytical & Micropreparative IEF
Wide pH gradients between 3-12
- ★ **Cup-loading anode**
Narrow pH gradients at the basic extreme
Improved quantification

© Görg 2007

© Görg 2007

Running conditions: Cup loading

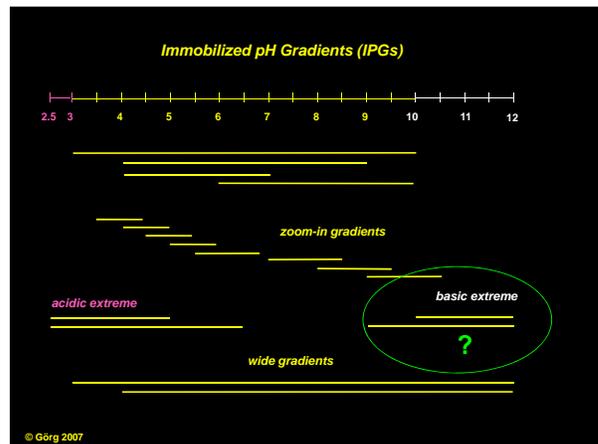

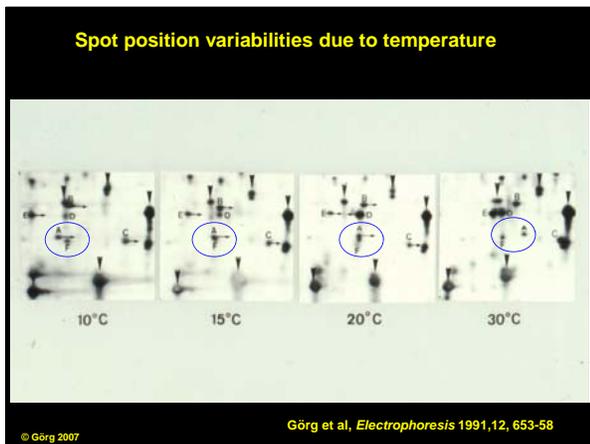

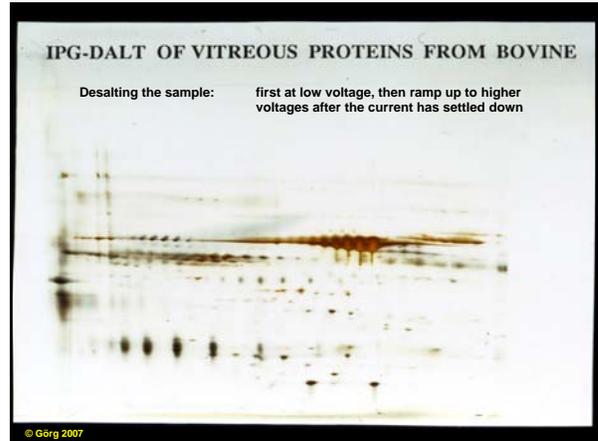

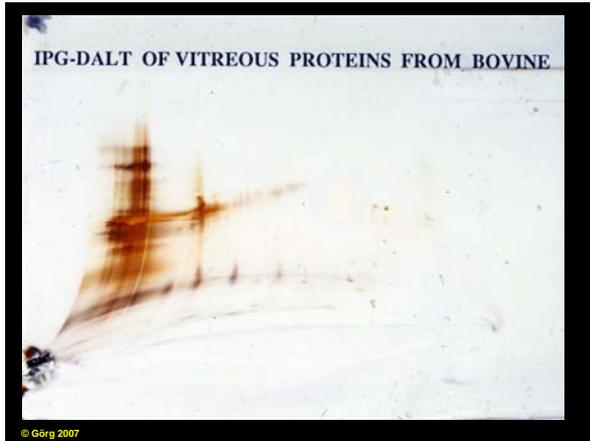

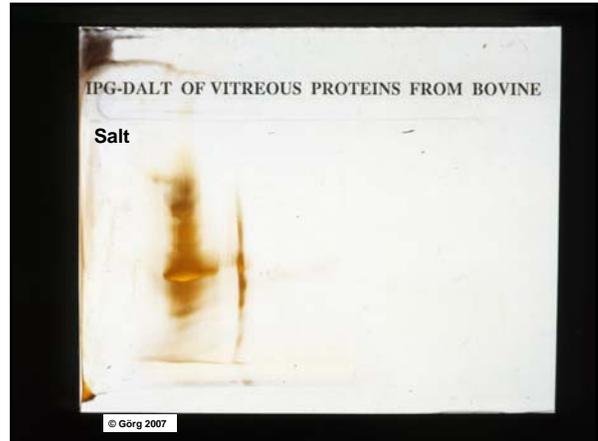

For all pH gradients
Mandatory for IPG 6-12 9-12 10-12

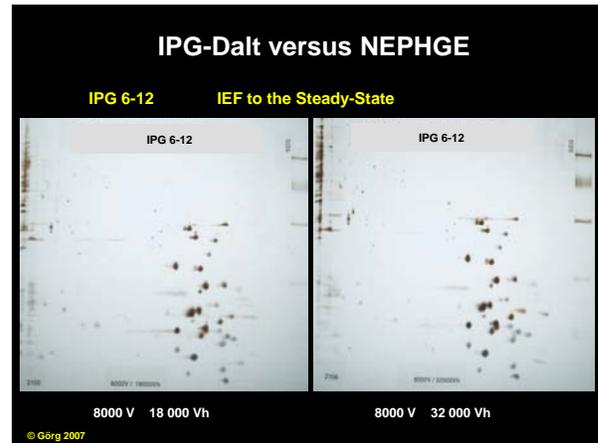

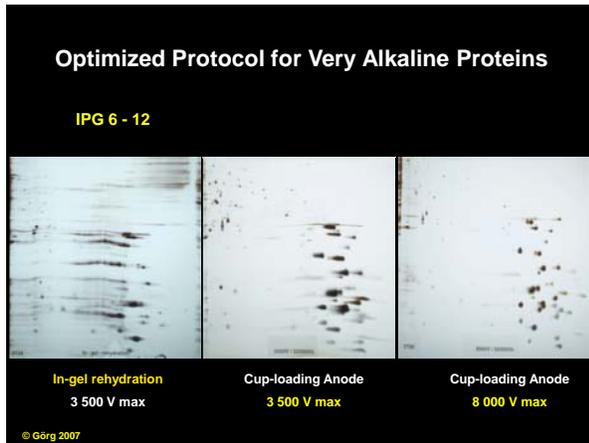

Gel length:	180 mm	Voltage max.:	8000 V
Temperature:	20°C	Current max.:	0.07 mA / IPG strip

Sample application Sample volume	Anode > 50 µl
---	-----------------------------------

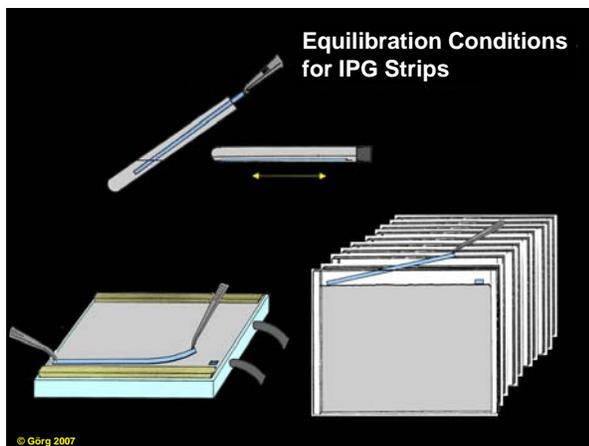

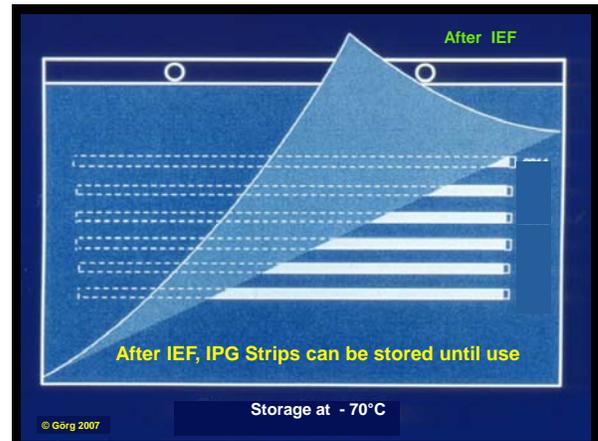

> Initial IEF	150 V 1 h 300 V 1 h 600 V 1 h
> IEF to the steady-state:	600 V → 8000 V ≈ 30 min 8.000 V → steady-state 32.000 Vh

© Görg 2007

- ### Optimized Protocol for IEF of Alkaline Proteins up to pH 12
1. Sample loading : Cup/Anode
 2. Sample entry : with limited voltage ~ 3 h not over night
 3. Final Voltage : up to 8 000 V
 4. Current max : 0.05 to 0.07 mA per strip
 5. IEF time (Vh) : to the steady-state, no overfocusing

Cy3 532 nm Cy5 633 nm Cy2 488 nm

Sample A Sample B Internal standard (Pooled Sample A+B)

Cyanine Fluorophores

- Structurally similar
- Spectrally distinct
- almost identical Mr
- Labeling lysine (ε-amino group)
- Charge compensation
- MS compatible

Mix

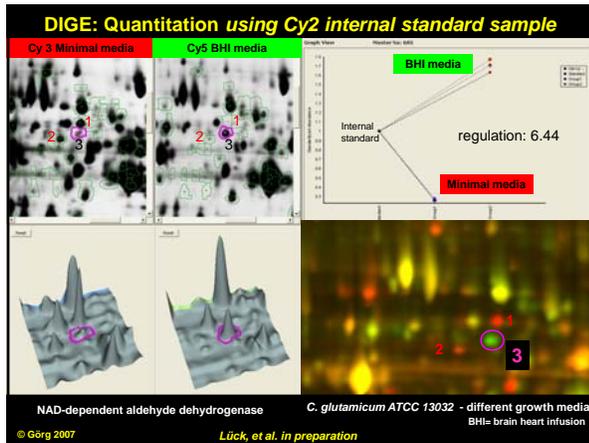

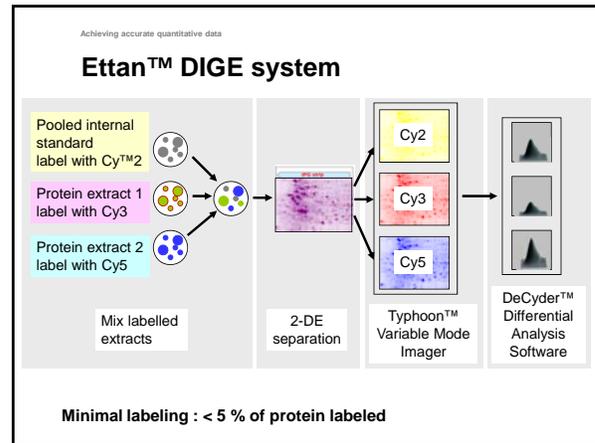

© Görg 2007

Minimum labeling < 5% of total protein
so that only proteins containing a single dye molecule are visualized on the gel

Sample solution : Lysis buffer pH 8.5
without carrier ampholytes, no DTT
30 mM Tris, 7M urea, 2M thiourea, 4% CHAPS

Labeling: CyDyes are reconstituted in DMF
50 µg protein is labeled with 400 pmoles of dye on ice-water for 30 min
reaction is stopped by adding 1 µL of 10 mM lysine

© Görg 2007

2-D Electrophoresis

Mouse liver

Limitations :

- Resolution
- Reproducibility
- Automation
- Quantitation
- Analysis of Proteins from 3 - 12

Sample solubilisation for 2-DE

"Classical" O'Farrell lysis buffer (1975)

9.5 M urea, 4% NP-40, 1% DTT, 2% synthetic carrier ampholytes

Alternative reagents

Chaotropes: increase sample solubility, minimize protein aggregation, proteins are unfold, denatured progressively
2 M thiourea, 7 M urea (Rabilloud *et al.*, 1997)

Detergents: disrupt hydrophobic interactions (protein-lipid and protein-protein interactions)
Linear sulphobetaines (SB 3-10, SB 3-12) (Rabilloud *et al.*, 1997)
CHAPS (Perdew *et al.*, 1983), C6BZ (Rabilloud *et al.*, 1999)
Triton X-114 phase partitioning (Wissing *et al.*, 2000)
SDS pre-solubilisation and detergent exchange

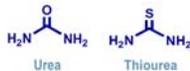

Reducing agents: disulfide bond cleaving agents

DTT

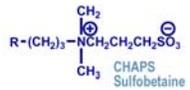

Tributyl phosphine (Herbert *et al.*, 1998)

© Görg 2007

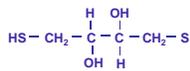

Sample preparation for 2D electrophoresis

Chaotropes: Disrupt hydrogen bonds and hydrophobic interactions
Note: Urea forms an equilibrium with ammonium cyanate and may modify (carbonylate) proteins. Do not heat > 37°C!

Detergents:
Break hydrophobic interactions & solubilize proteins
Note: Must not carry a net charge (-> non-ionic or zwitterionic)

Reductants:
Reduce disulphide (-S-S-) bonds

Carrier Ampholytes:
- Improve sample solubilization
- Act as cyanate scavengers

© Görg 2007

Sample application by „in-gel rehydration“

Sample volume	350 µl	Gel length:	180 mm
	450 µl		240 mm

Protein concentration	5-10 mg/ml Lysis buffer
-----------------------	-------------------------

Lysis buffer	7 M urea/2M thiourea 4% CHAPS 2 % Carrier Ampholytes 1% DTT
--------------	--

Rehydration solution	6 M urea/2M thiourea 1-2% CHAPS 1 % Carrier Ampholytes 0.4% DTT
----------------------	--

For in-gel rehydration the sample (dissolved in lysis buffer) is diluted with rehydration solution to the appropriate amount of volume

© Görg 2007

Sample application by „cup loading“

Protein concentration	5-10 mg/ml Lysis buffer
-----------------------	-------------------------

Sample volume	50 µl min 100 µl max
---------------	-------------------------

Lysis buffer	7 M urea/2M thiourea 4% CHAPS 2 % Carrier Ampholytes 1% DTT 10 mM PMSF
--------------	--

Rehydration solution	6 M urea/2M thiourea 1-2% CHAPS 1% Carrier Ampholytes 0.4% DTT
----------------------	---

Alternatively:
DeStreak Solution
(HED instead of DTT)

© Görg 2007

Sample Prefractionation by IEF in Sephadex Gels

Sephadex Slurry	210 mg Sephadex G-100SF reswollen (> 24 h) in 3.0 ml rehydration solution (8M urea, 1%CHAPS, 200mM HED, 2.5% carrier ampholytes) (alternatively: DeStreak Solution)
-----------------	---

Sample Solution	5-10 mg protein / ml in 9.5M urea, 2% CHAPS, 1% DTT, 1% carrier ampholytes, 10mM Pefabloc (or PMSF)
-----------------	---

Preparation of Sephadex Gel	1.5 ml sample solution + 5 µl coloured pl marker are added to 3.0 ml Sephadex slurry and poured onto the flatbed tray
-----------------------------	---

Sephadex-IEF	Temperature: 20°C Separation distance: 10 cm Settings: 100 V (30 min); 200 V (30 min); 600 V (1h); 1000 V (2 h)
--------------	---

IPG-IEF	Transfer of Sephadex fractions onto rehydrated IPG strips - 1 cm of Sephadex fraction is applied onto surface (near the anode) of the corresponding narrow range IPG strip - protect surface with 2 ml of IPG strip cover fluid - continue with IPG-IEF as described for cup-loading
---------	---
