

## Mean annual volume growth m<sup>3</sup> ha<sup>-1</sup> yr<sup>-1</sup> on long-term experiments across Europe since 1860

### Time of establishment and main questions of long-term experiments in Bavaria

Establishment of a new generation of species mixing experiments from 2017-2023 on about 120 ha with factors: species, site conditions, mixing patern, stand density

# Long-term experiments in forests. Essential for facts on stand dynamics and evidence of human influence

Hans Pretzsch

Chair for Forest Growth and Yield Science

#### Technical University of Munich

http://waldwachstum.wzw.tum.de/index.php?id=presentations

- 1 Tradeoff between thinning effects on tree size growth and stand volume production
- 2 Overyielding of mixed-species versus mono-specific stands
- 3 Biomonitoring of growth trends driven by environmental change

http://waldwachstum.wzw.tum.de/index.php?id=presentations

Self-thinning variant on the long-term thinning experiment in Norway spruce FFB 612, South Bavaria, Germany

Revelation of self-thinning lines (green) on long-term thinning experiments with different treatment variants

Waldwachstumskunde Systemanalyse

From thinning trials to density-productivity relationships

Tradeoff between stand productivity and mean tree growth on Scots pine combined spacing-thinning trial WEI 611

ТЛ

Long-term experiments record self-thinning, remaining and removal stand, total production, density-productivity relationship, and tradeoff between stand and mean tree

### Experimental setup for scrutiny of mixing effects Zwiesel 111/3,4,5 Bavarian Forest

 $p_{1,2}$  compared with  $p_1 \times m_1 + p_2 \times m_2$ 

#### Meta-analyses of overyielding in mixed vs. pure stands

Pretzsch, Forrester, Bauhus (2017) Mixed-species forests. Ecology and management, Springer, Berlin, 653 p

Effect of tree species mixing on stand density represented by self-thinning line and SDI

# Mixing effects in terms of overyielding can emerge from stand density and can be eliminated by thinning

Amorosos and Turnblom (2006) Comparing productivity of pure and mixed Douglas-fir and western hemlock plantations, Canadian Journal of Forest Research 36:1484-1496

Long-term mixing experiments can reveal the effect of mixing on stand density, remaining and removal stand, and any overyielding in total production

## Changes in the ranking and growth of different Scots pine provenances on long-term trials in Bavaria

Waldwachstumskunde Systemanalyse Degradation in the site fertility by repeated cultivation of Norway spruce in Saxonia revealed by long-term survey

G

Wiedemann E (1923, p 157, Tab. 1)

### Changes of the total stand volume production on 577 long term trials in Europe since 1860

#### Growth trends of Scots pine in Europe

#### Scots

- a given total stand volume production and standing stock is reached 50 years early than 100 years ago
- at the age of 75 intermediate yield is 200 m<sup>3</sup> ha<sup>-1</sup> while it was 75 m<sup>3</sup> ha<sup>-1</sup> 100 years ago,
- this means an increase of intermediate yield by 150 %.

#### NORMAL YIELD TAI

٩		MAIN CROP After Thinning								Yield
