

Mixed-species forests. Their structure, growth, and yield compared with monocultures

Hans Pretzsch
Chair for Forest Growth and Yield Science
Technical University of Munich

<http://waldwachstum.wzw.tum.de/index.php?id=presentations>

Mixed European beech forest in Central European lowlands

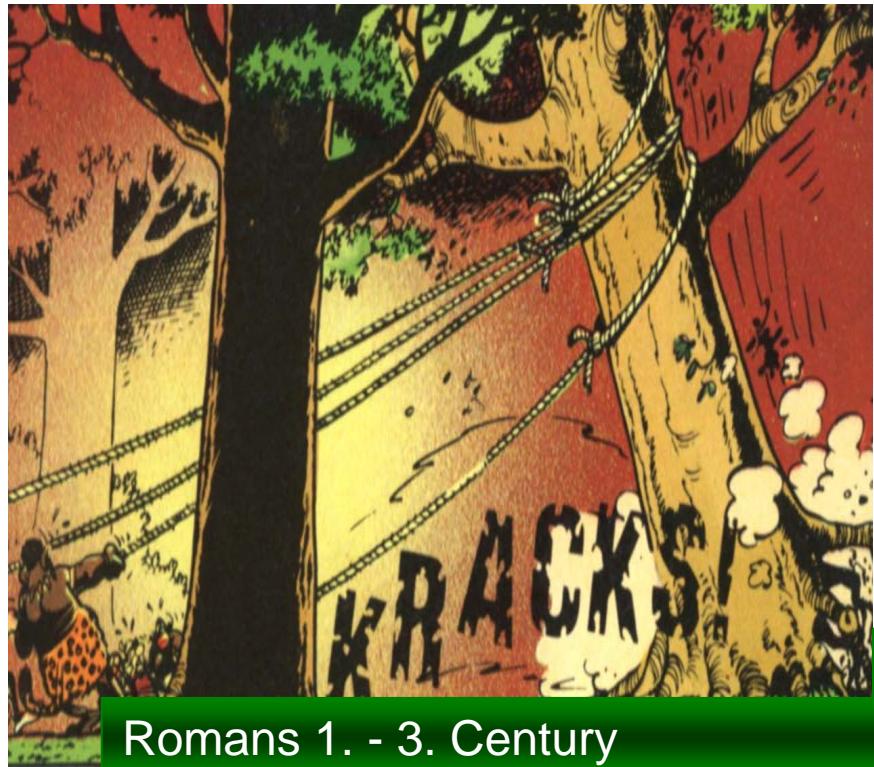

Mixed spruce-fir-beech mountain forest in montane and subalpine zones (600-1,400 m a.s.l.)

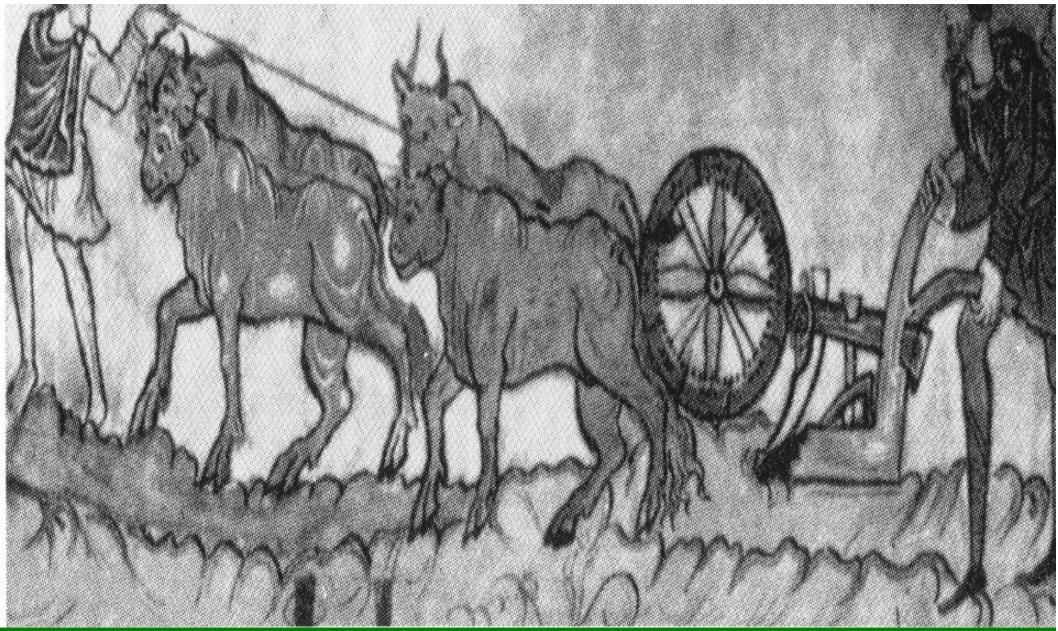

Criteria for sustainable forest ecosystem management. Objective hierarchy for the management of municipal forest Traunstein

Criteria for sustainable forest management	Indicators	Weight (%)
Forest resources	timber resources, area of forest, extension of area	20
Health and vitality	stability, fitness, elasticity	17
Productive functions	growth, yield, net return	12
Biological diversity	habitat quality, richness flora/fauna, conservation	10
Protective functions	soil, water, climate, noise, protection	10
Socio-economic functions	employment, recreation, esthetics, proximity to nature	31

Romans 1. - 3. Century

Clearings in medieval times 12. – 13. Century

Industrialisation 18. – 19. Century

World War I. und II. 20. Century

humanmade Norway spruce monocultures in the lowlands

Neerdar, Sauerland, 1959

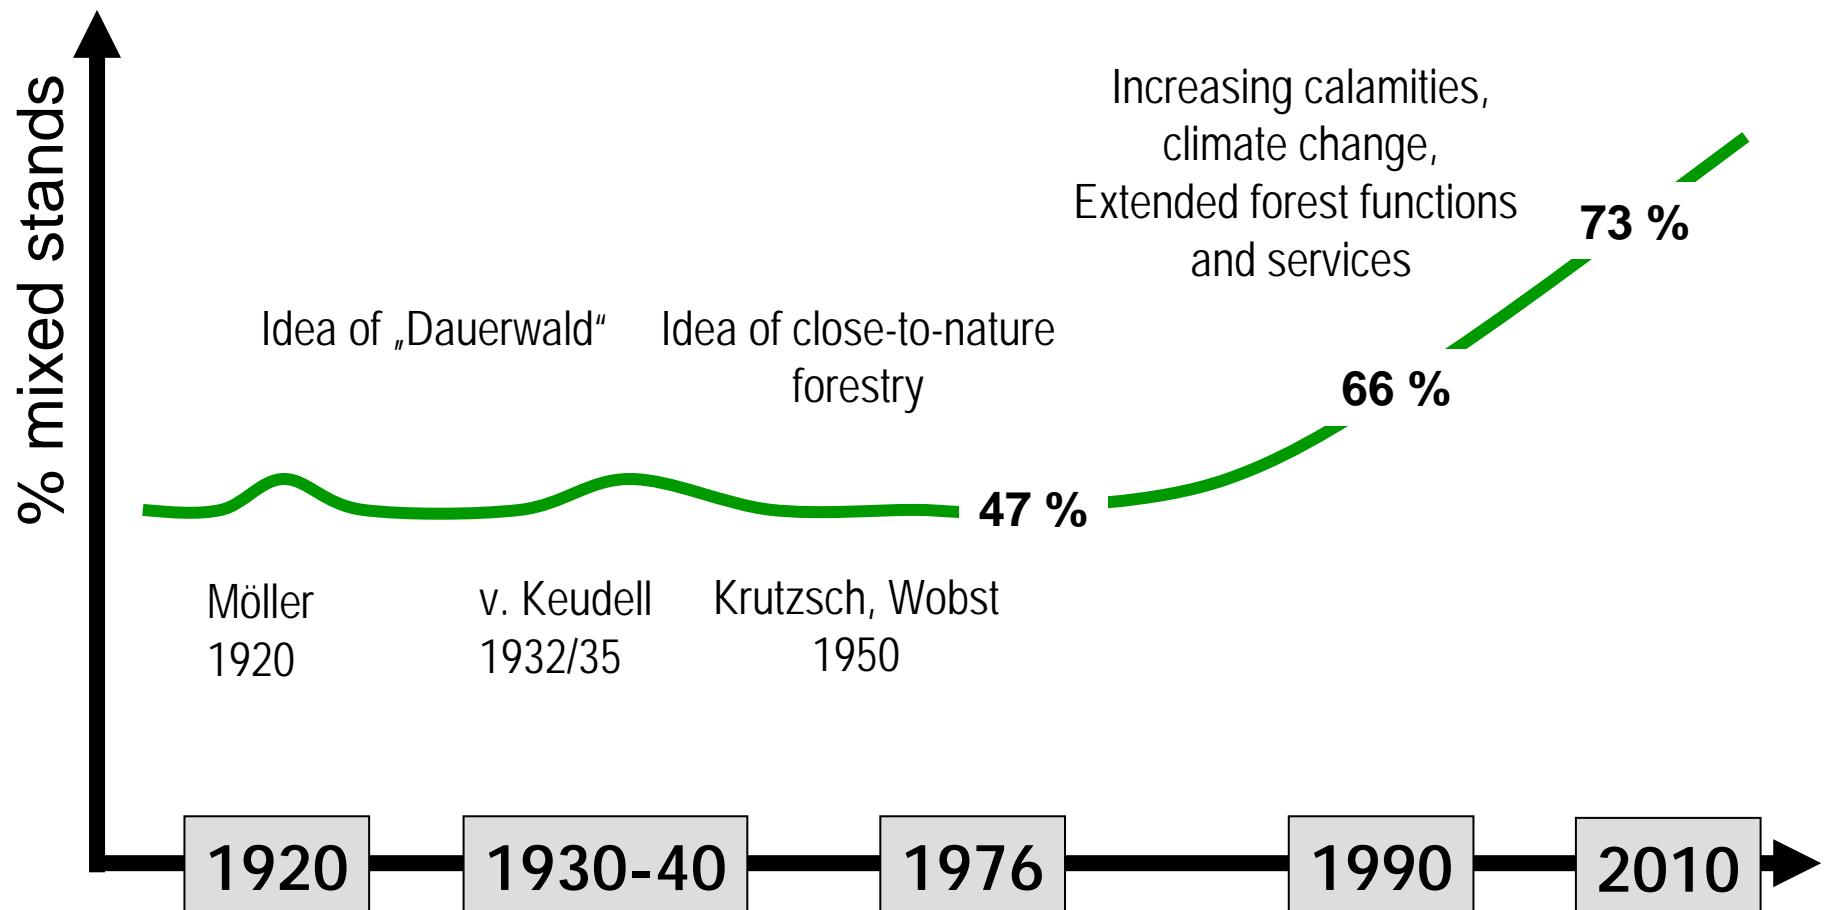

Norway spruce stands damaged by bark beetle
Rachel und Lusen, Bavarian Forest, 2010

**Storm damage by Gudrun
>75 million m³ Småland,
Schweden, 2005**

Back to complex mixed-species forests. From the idea to realization in Bavaria

Mixing proportions (>10 % stand area) according to inventories GRI 1971, BWI I 1987, BWI 2 2002, BWI 3 2014 in Bavaria

Mixed-species forests. Their structure, growth, and yield compared with monocultures

Technical University of Munich

<http://waldwachstum.wzw.tum.de/index.php?id=presentations>

- 1 Tree species mixing and stand productivity
- 2 Effect of mixing on population structure, size distribution
- 3 Effect on allometry at the tree and organ level
- 4 Main causes of mixing effects, modification with site conditions
- 5 From analysis to design of mixed species stands

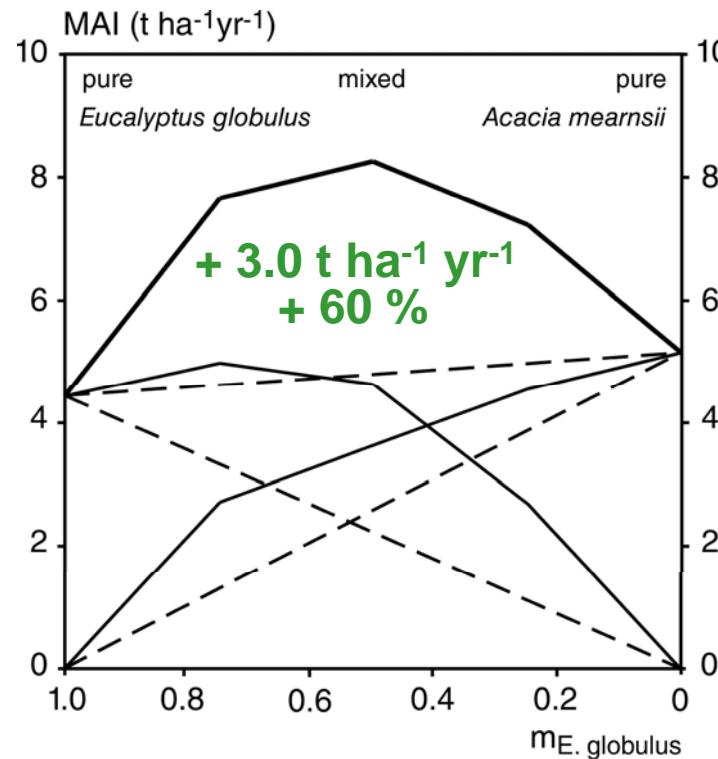

Experimental setup for scrutiny of mixing effects

Zwiesel 111/3,4,5 Bavarian Forest

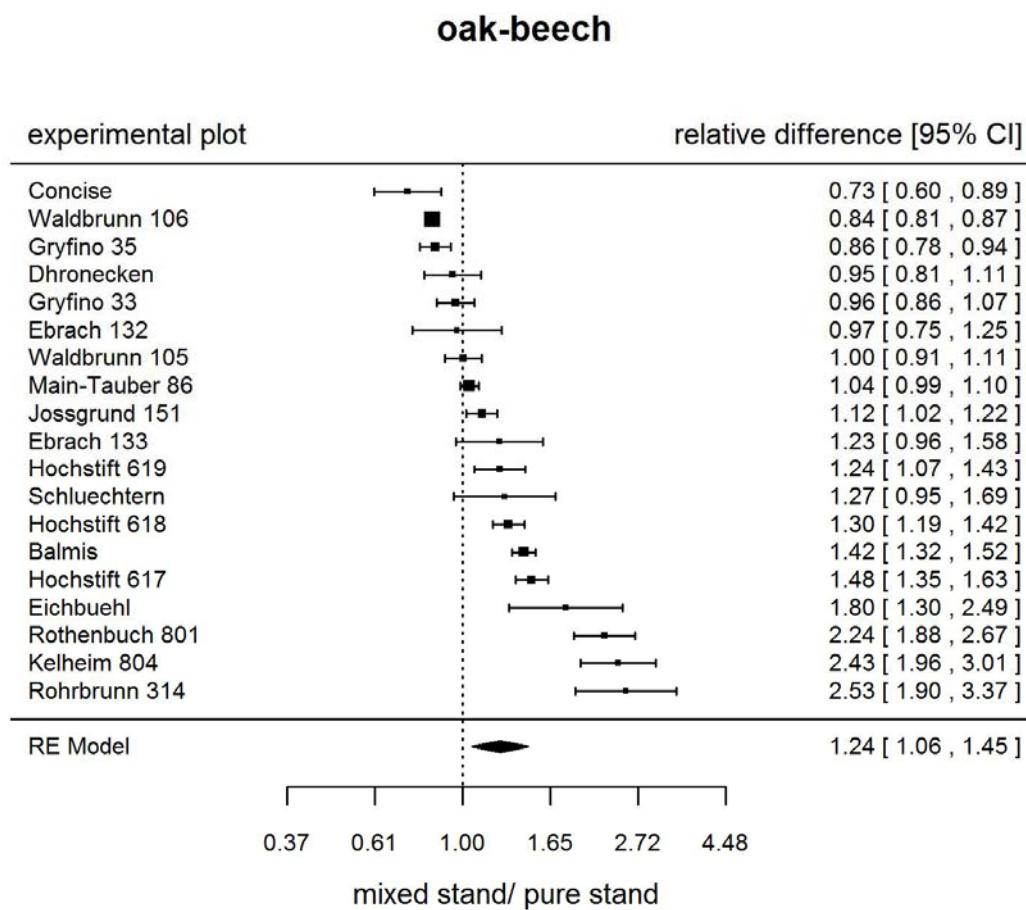

$p_{1,2}$ compared with $p_1 \times m_1 + p_2 \times m_2$

Overyielding in mixed versus pure stands of *Eucalyptus globulus* Labill and *Acacia mearnsii* De Wild.

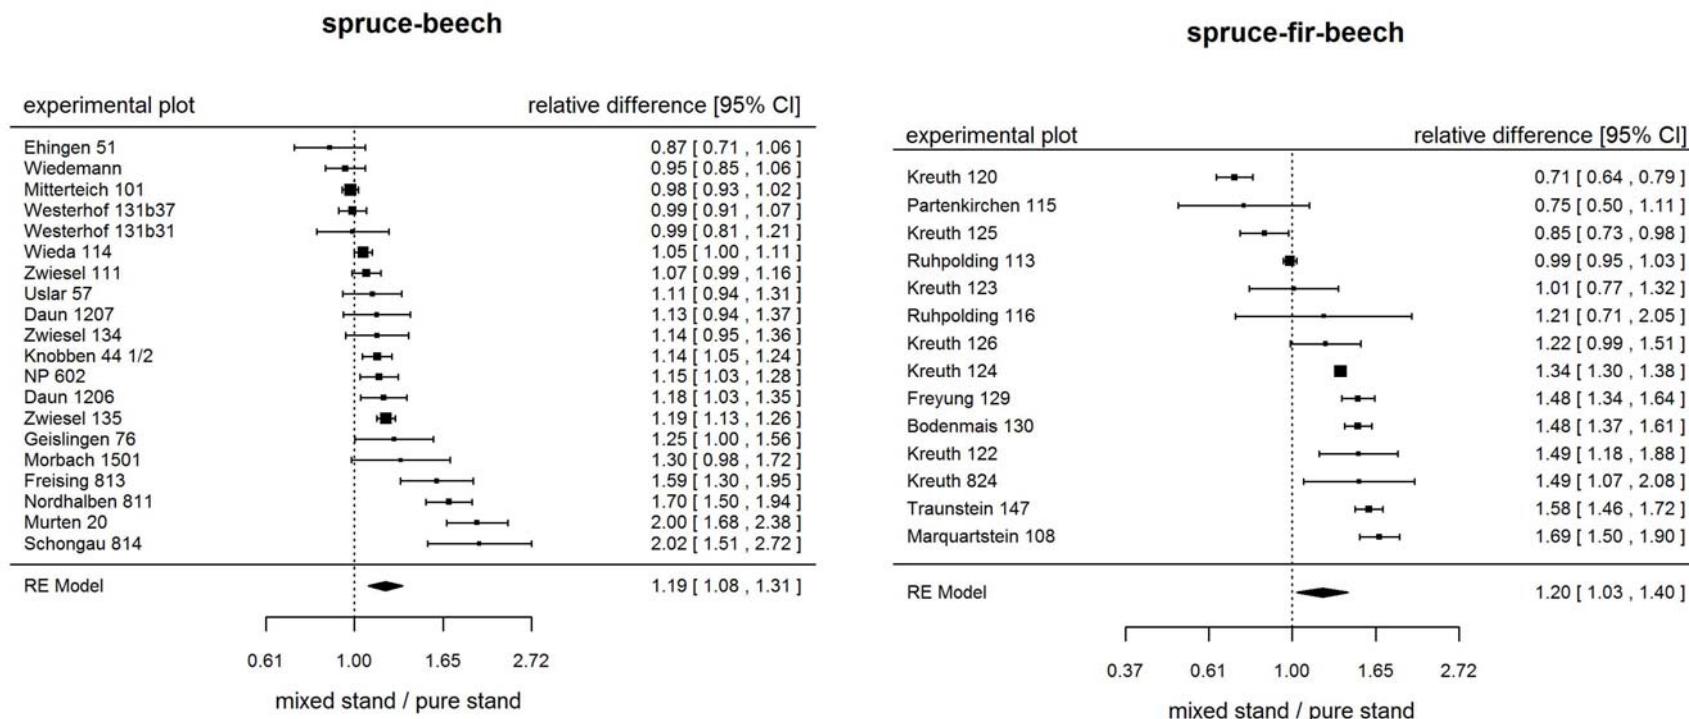

Forrester et al. (2006), Pretzsch and Forrester (2017)

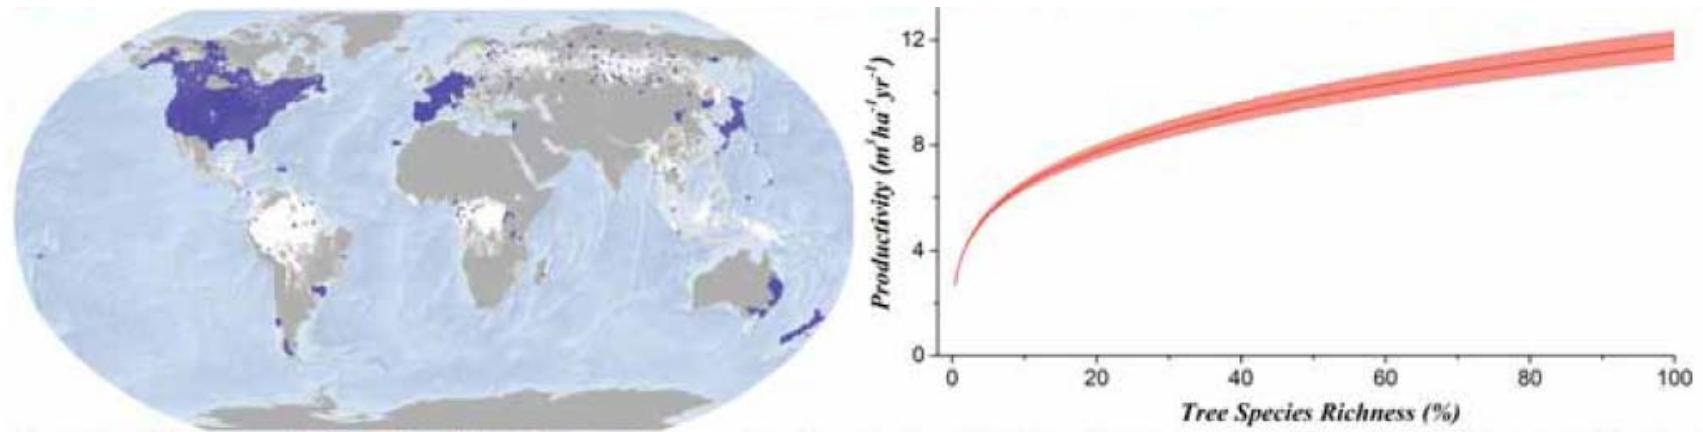

Meta-analysis on overyielding of mixed stands of sessile oak and European beech versus pure stands in Europe based on long-term experiments

Meta-analysis on overyielding of mixed stands of Norway spruce, European beech, silver fir in Europe based on long-term experiments

Mixing effects on productivity of forests worldwide and in Central Europe

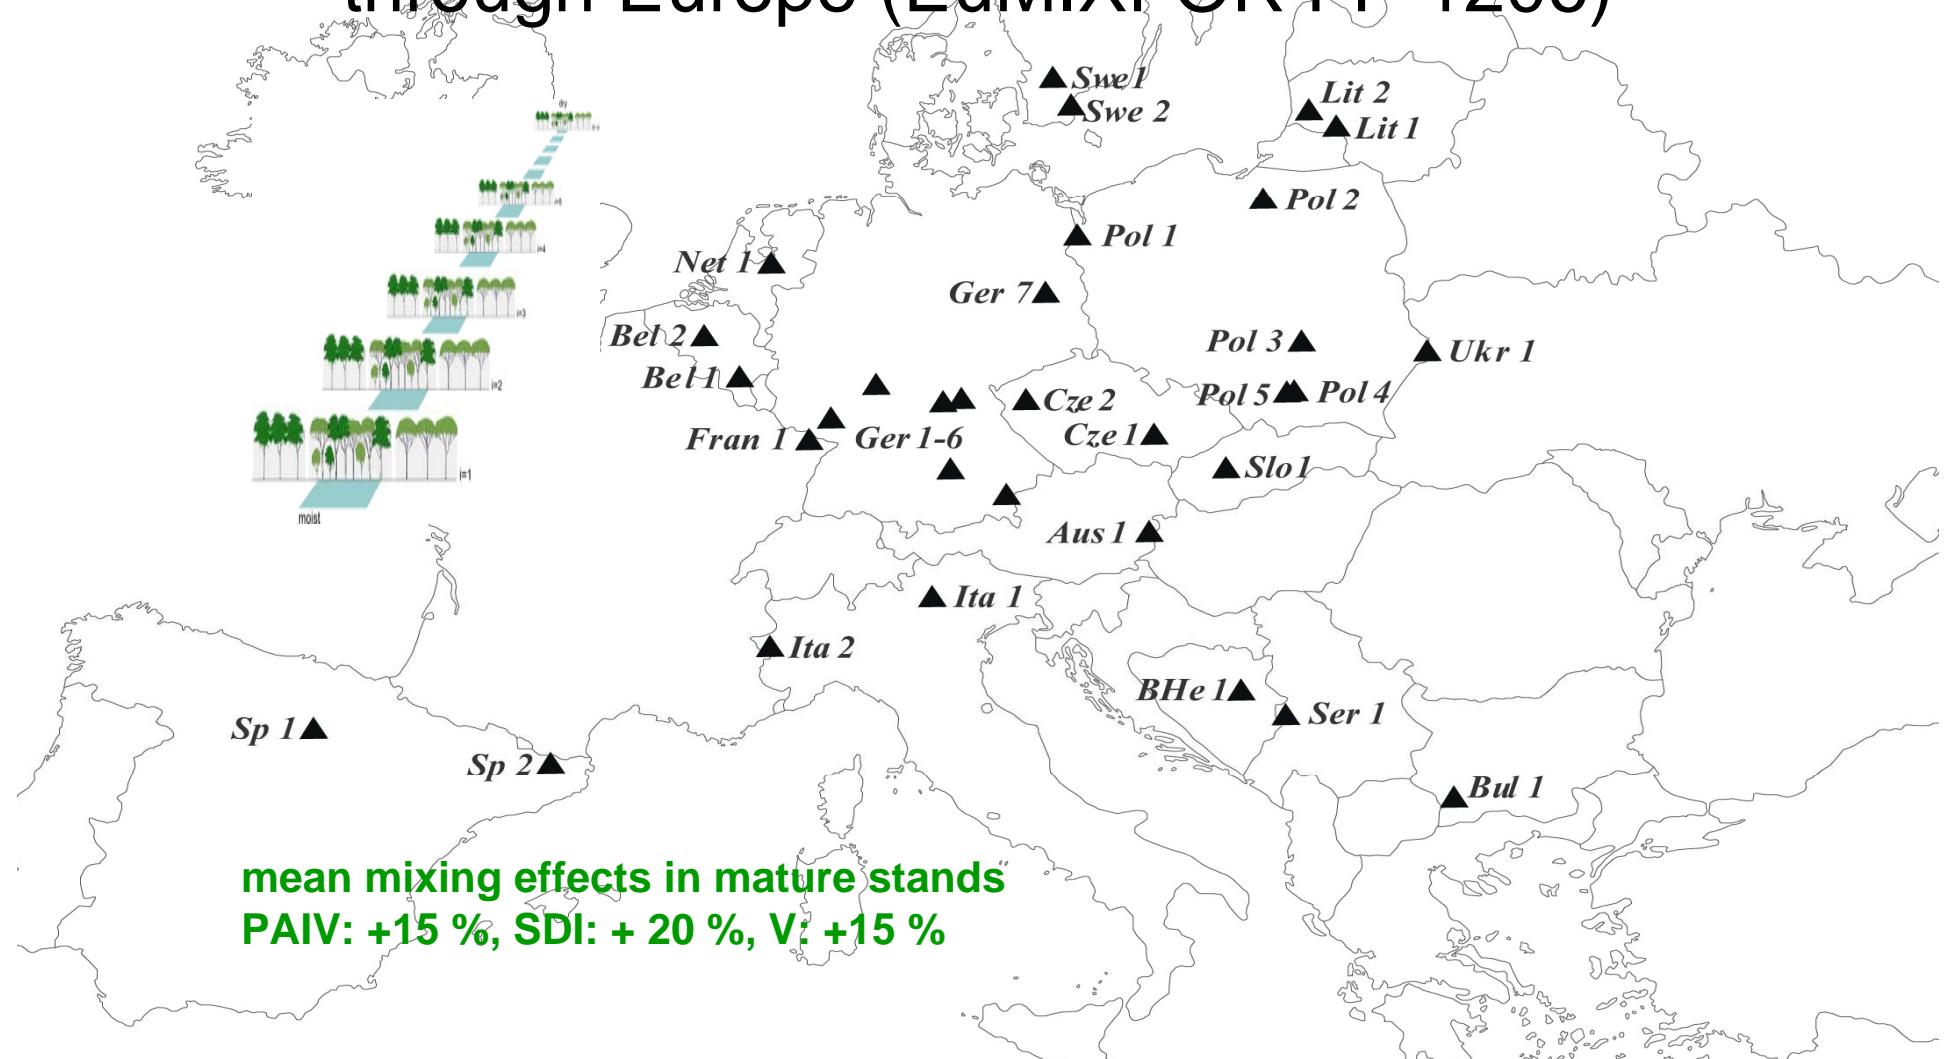

Liang, J. et al. (2016) Positive Biodiversity-Productivity Relationship Predominant in Global Forests, Science, 354 (6309), aaf8957

Species combination	N. sp/ E. be	S. pi/ E. be	s. oak/ E. be	E. be/ D-fir	S. pi/ N. sp	E. la/ N. sp	N. sp/ s. fir	mean
overyielding	21	30	20	11	21	25	13	
(± SE) in %	(± 3)	(± 9)	(± 3)	(± 8)	(± 11)	(± 6)	(± 6)	
corr. factor	1.10	1.20	1.10	1.10	1.20	1.20	1.10	1.10

Pretzsch (2016) Ertragstafel-Korrekturfaktoren für Umwelt- und Mischungsgeffekte, AFZ Der Wald, 14/2016: 47-50

Mixing effects on 32 triplets of Scots pine and European beech along a productivity gradient through Europe (EuMIXFOR FP 1206)

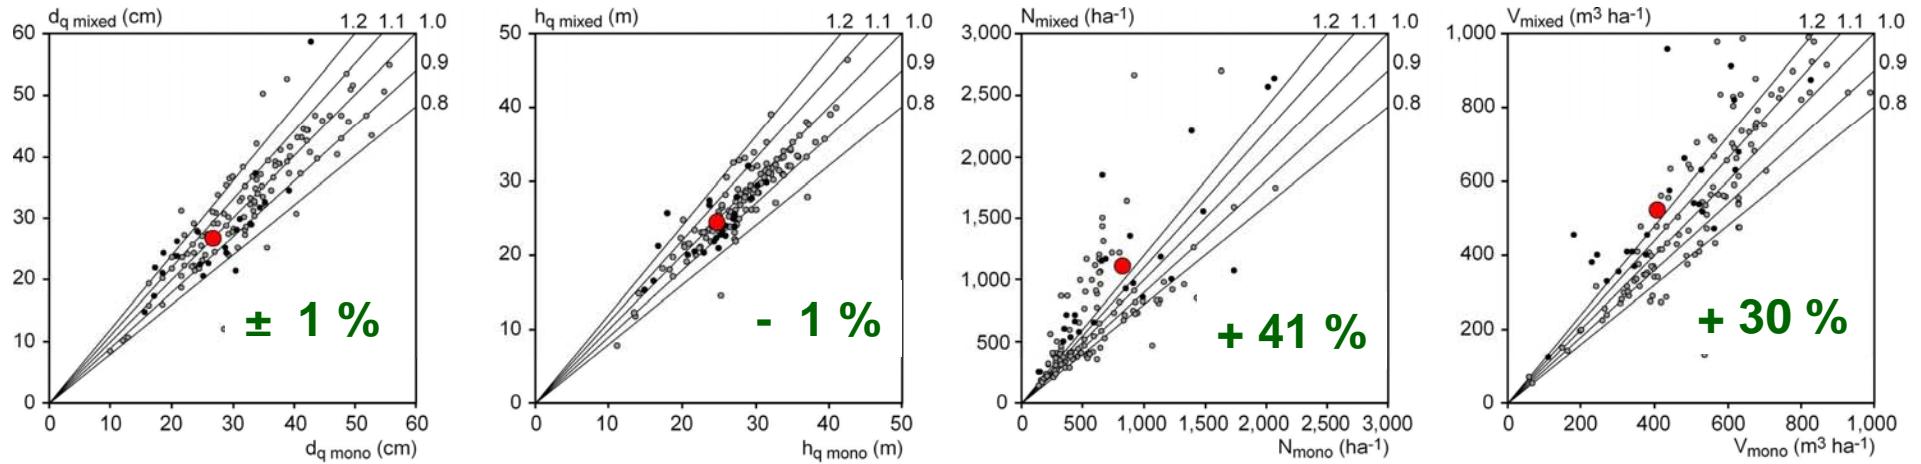

Mixing effects on 32 triplets of Scots pine and European beech along a productivity gradient through Europe (EuMIXFOR FP 1206)

Summary 1:

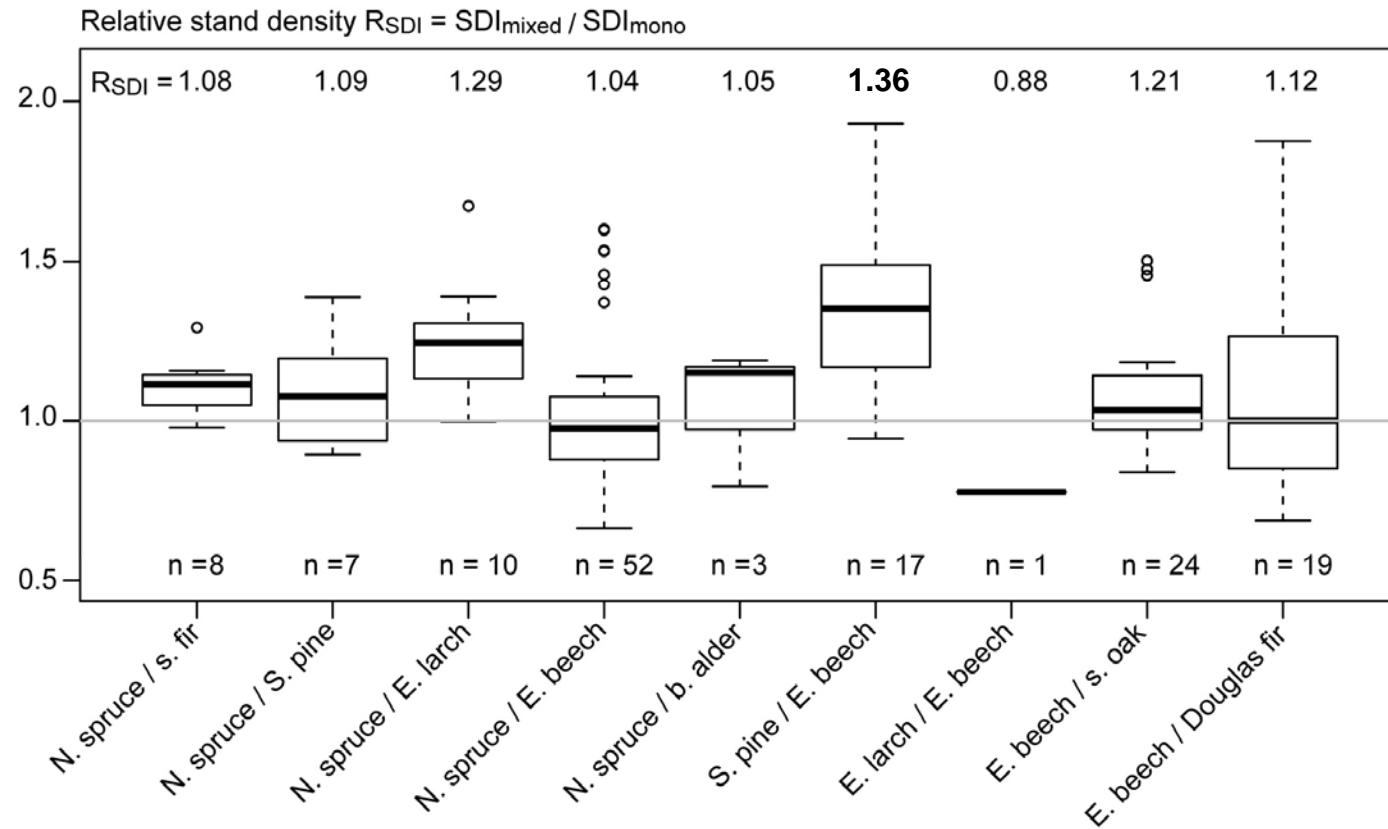

- overyielding of 15-30 % of mixed vs. pure stands
- occasionally also neutral or negative effects
- conservative correction factors: $iv_{pure} \times 1.10$ to 1.20
- more species combinations need to be analyzed

mean mixing effects in mature stands
PAIV: +15 %, SDI: + 20 %, V: +15 %

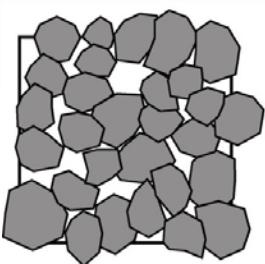

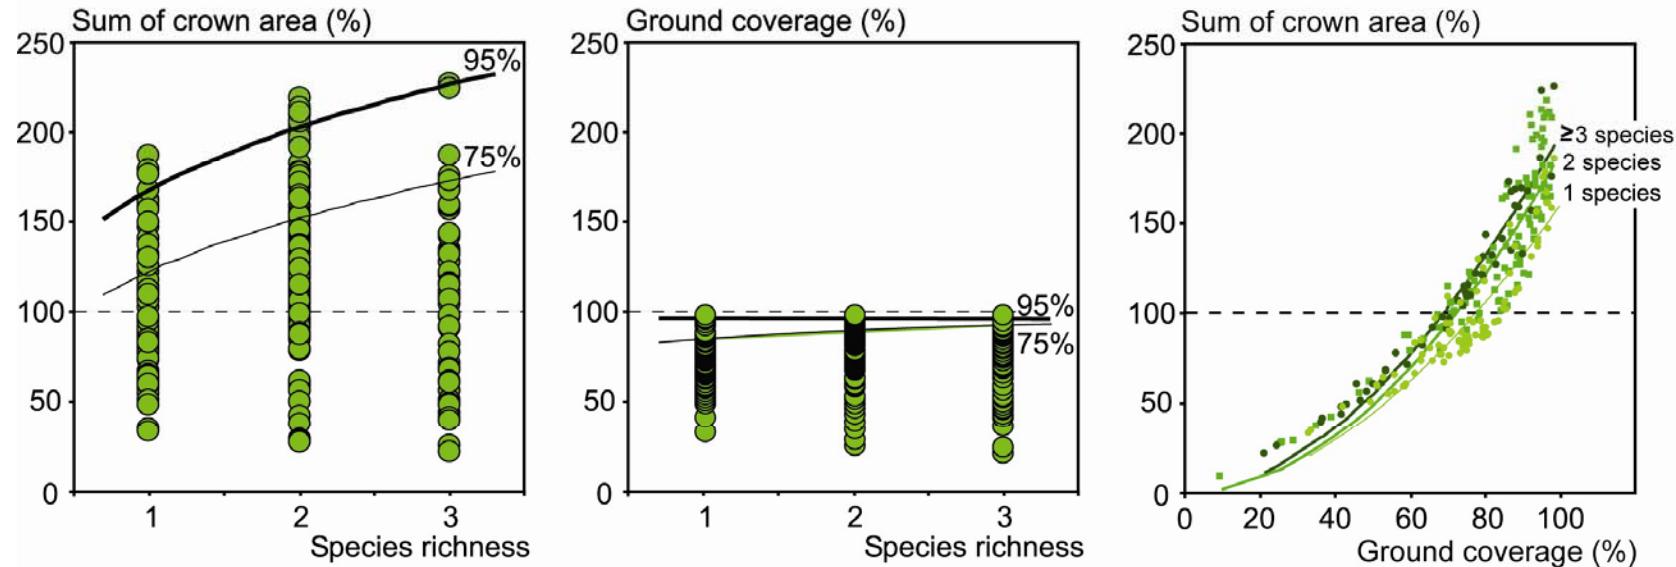

Mixing increases tree number and standing volume rather than mean tree diameter or height

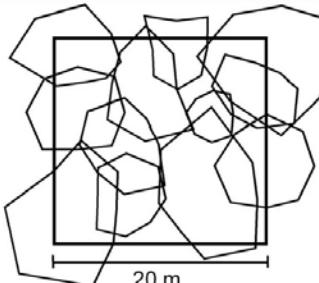

Stand density (SDI) of mixed-species stands versus monocultures on long-term experiments in Central Europe

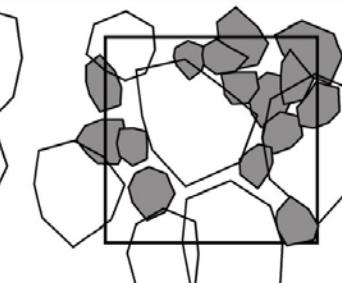

Denser canopy space filling in mixed stands: higher sum of crown area and multiple ground coverage

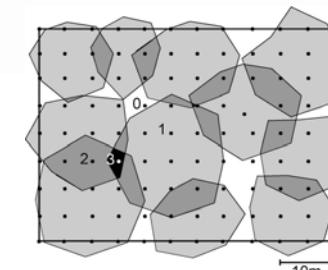

Norway spruce
pure

European beech
pure

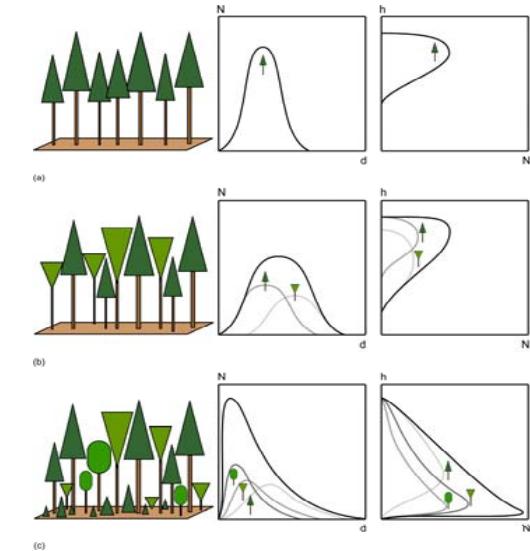

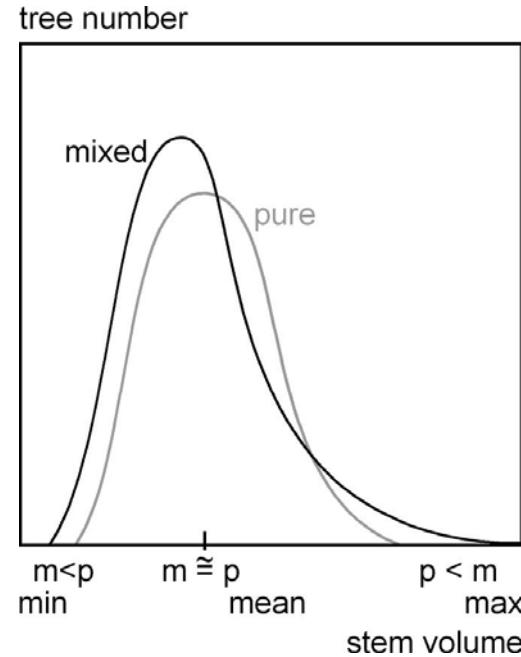

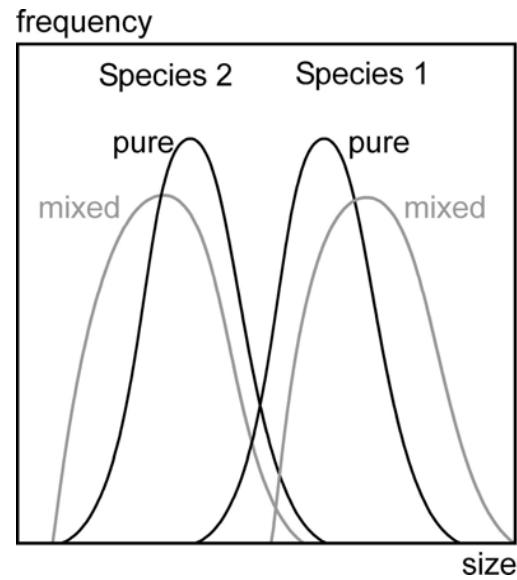

Norway spruce /
European beech
mixed

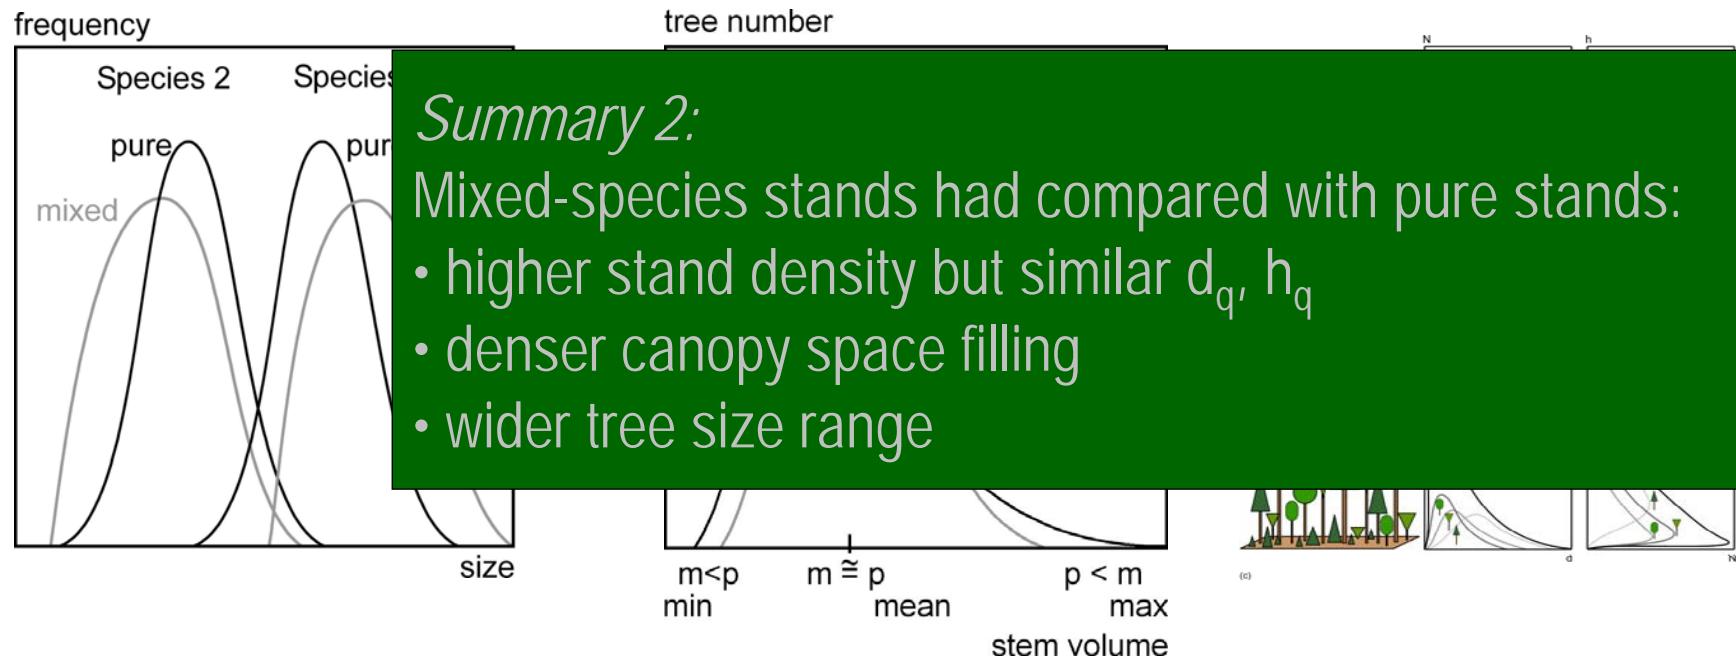

Pretzsch, H. (2014) Canopy space filling and tree crown morphology in mixed-species stands compared with monocultures. Forest Ecology and Management, 327: 251-264.

More trees, wider size range, stronger right-skewness in mixed stands; often species 1 ahead, species 2 behind the monoculture

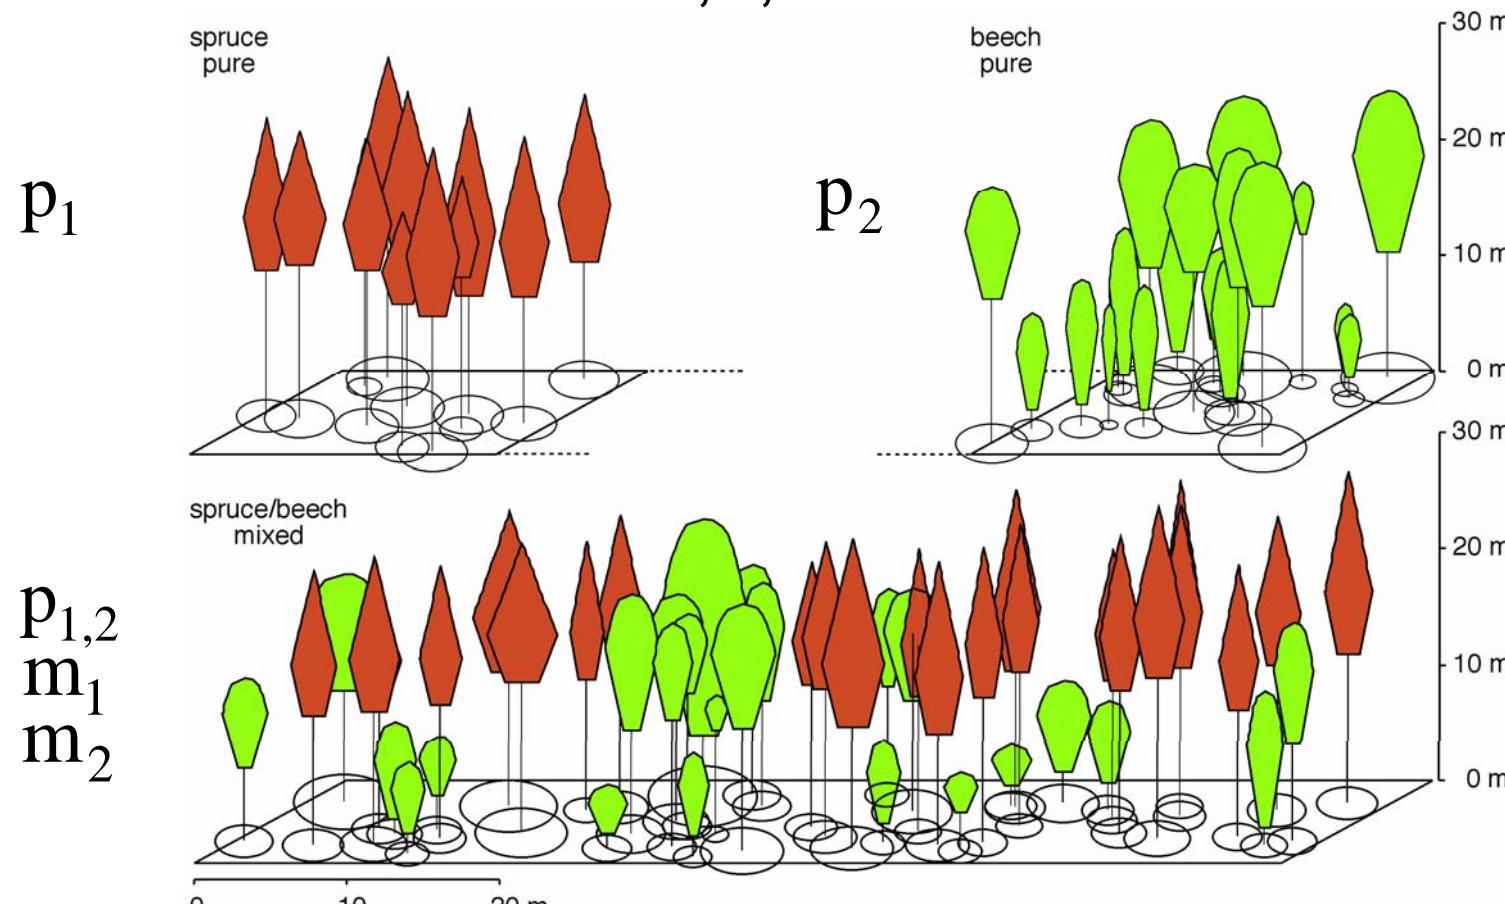

More trees, wider size range, stronger right-skewness in mixed stands; often species 1 ahead, species 2 behind the monoculture

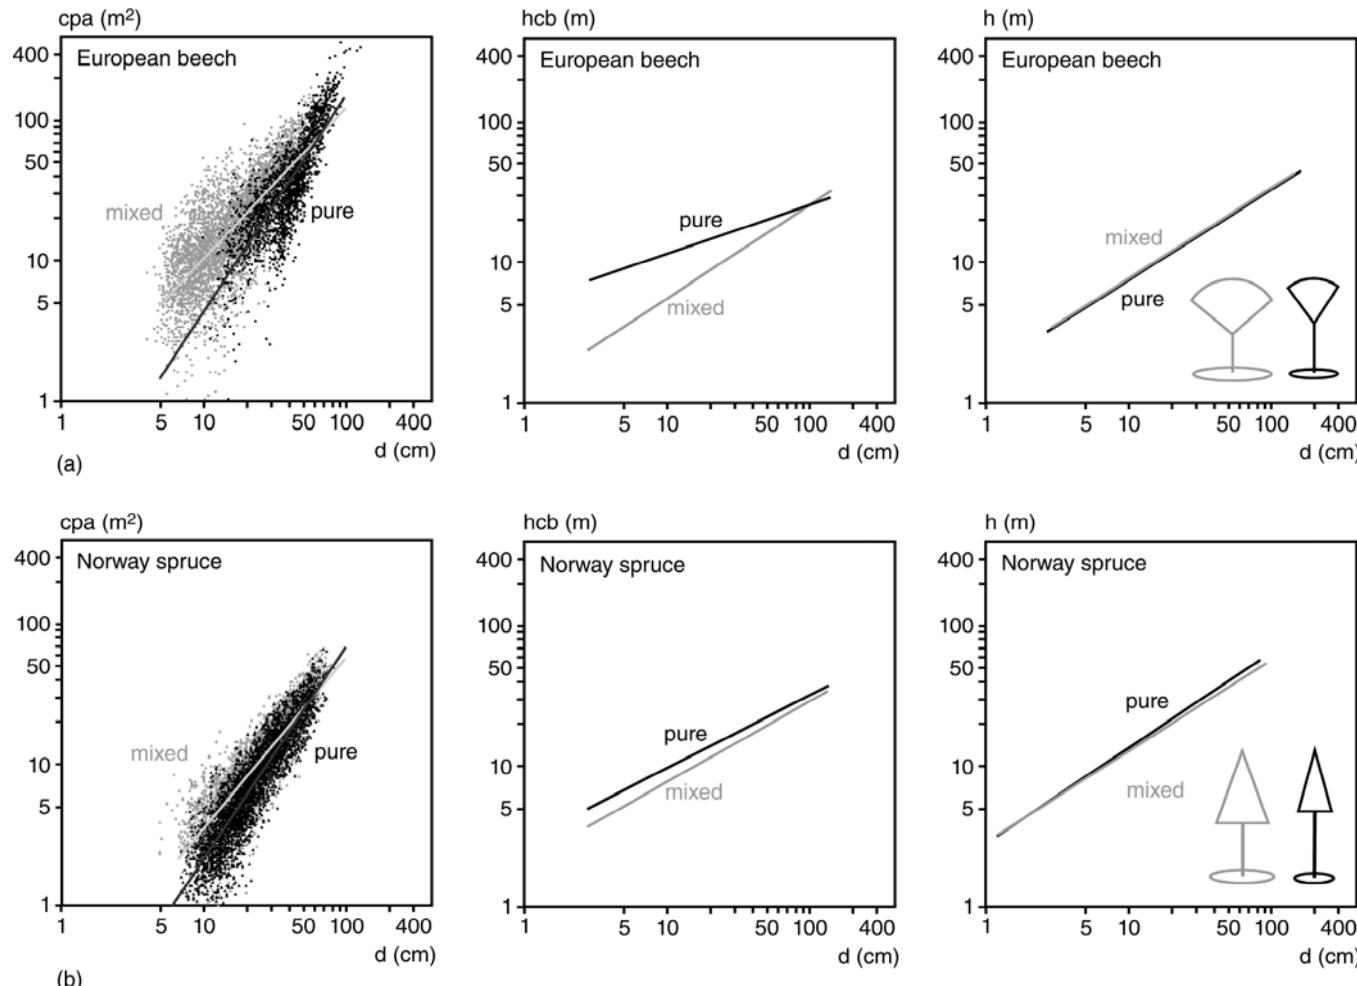

Experimental setup for scrutiny of mixing effects

Zwiesel 111/3,4,5 Bavarian Forest

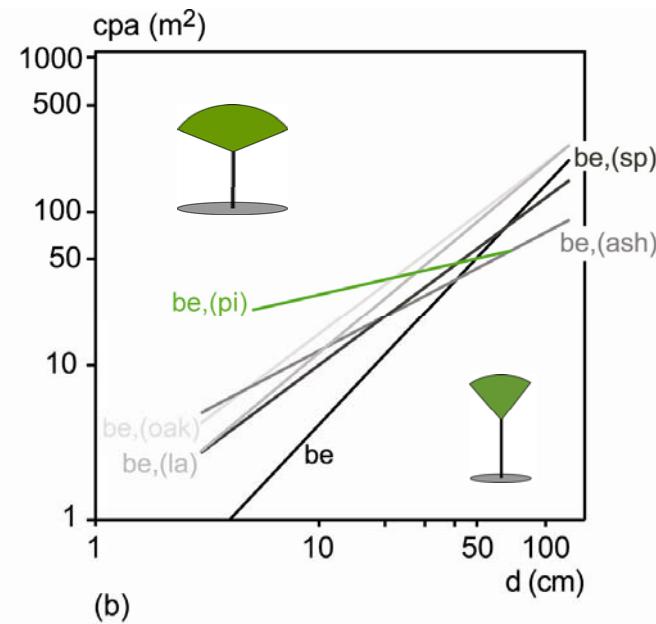

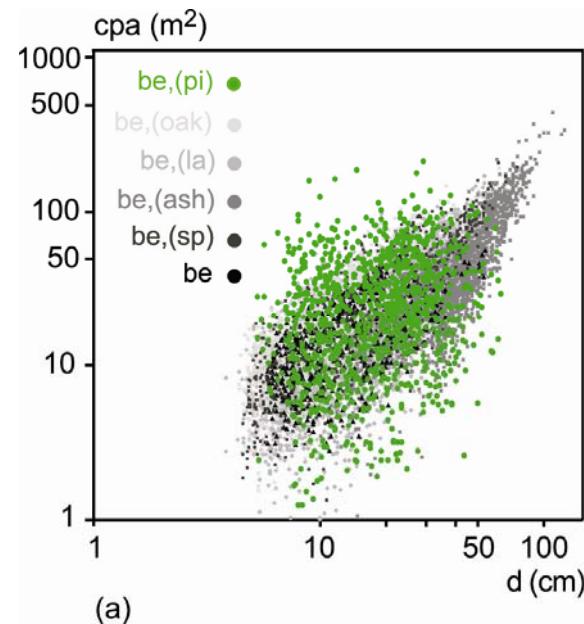

$p_{1,2}$ compared with $p_1 \times m_1 + p_2 \times m_2$

Effect of species mixing on the crown allometry of European beech and Norway spruce

Pretzsch, H. (2014) Canopy space filling and tree crown morphology in mixed-species stands compared with monocultures. Forest Ecology and Management, 327: 251-264.

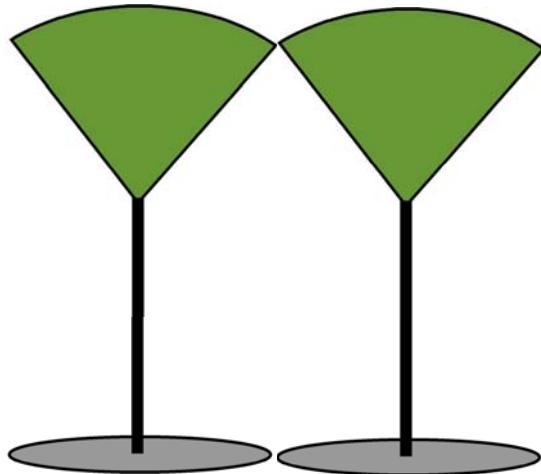

Allometry between crown projection area and stem diameter of European when growing in mono-specific versus mixed stands

S. pine
s. oak
E. ash
E. larch
N. spruce

Morphological differences in intra- vs. inter-specific environment despite of equal biomass

beech/beech

branch number

19 vs. 36

branch length

4.8 m vs. 4.3 m

branch angle

139° vs. 128°

branch straightness

96 vs. 94

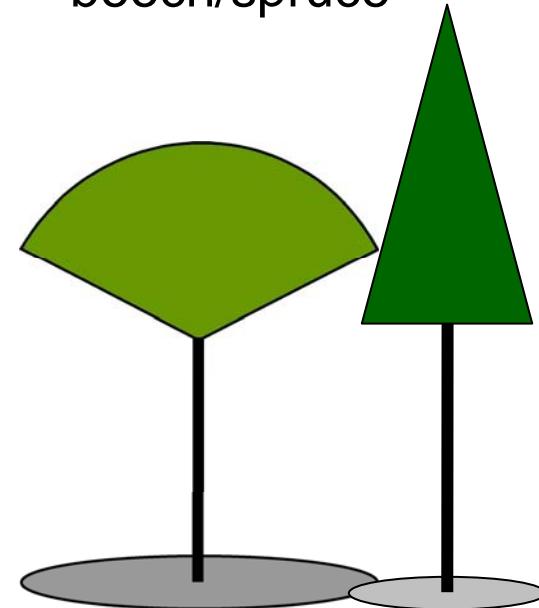

stem inclination

2° vs. 3.5°

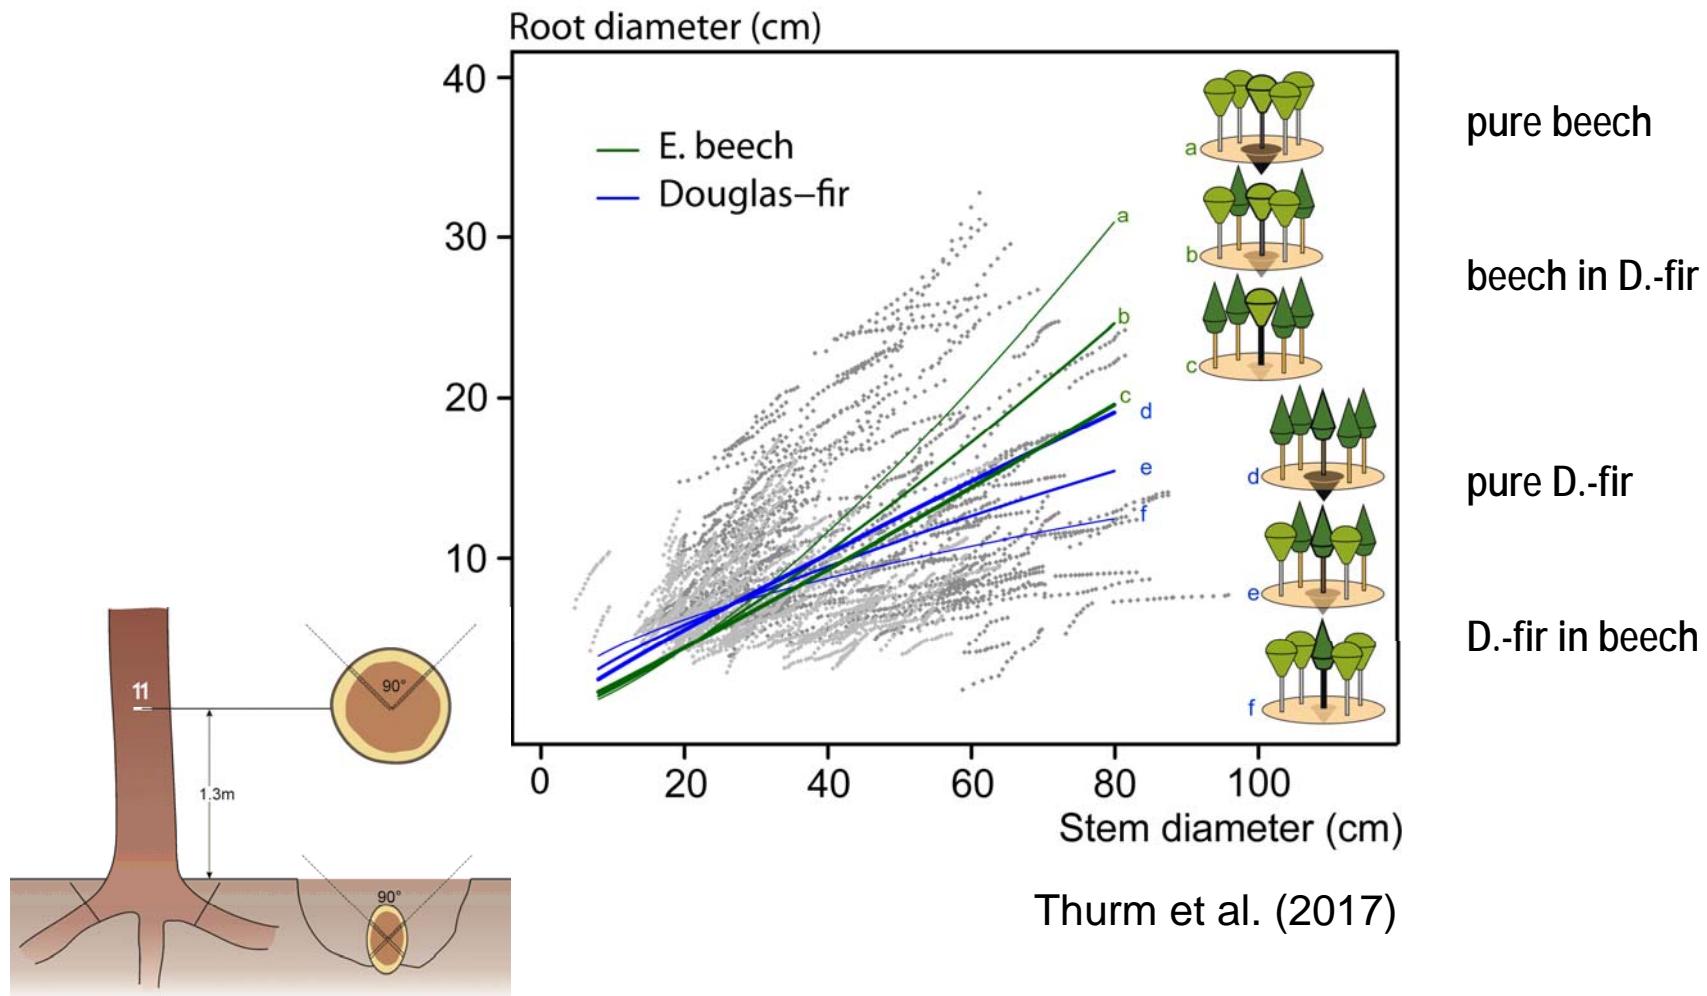

crown volume

25 m³ vs. 59 m³

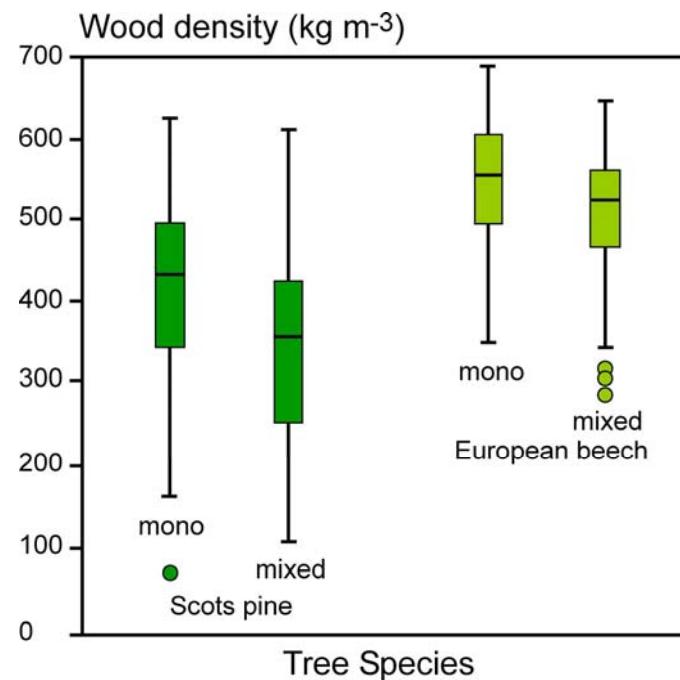

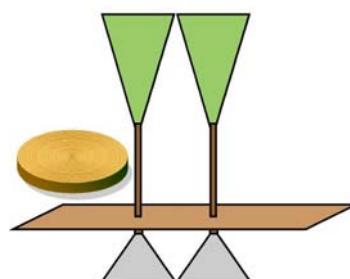

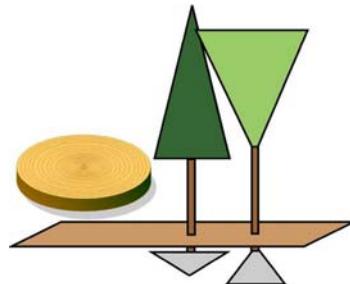

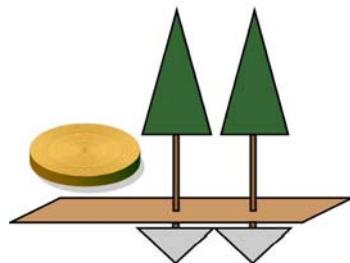

beech/spruce

Enhancement of shoot in relation to coarse root growth in mixed compare with mono-specific stands of European beech and Douglas-fir

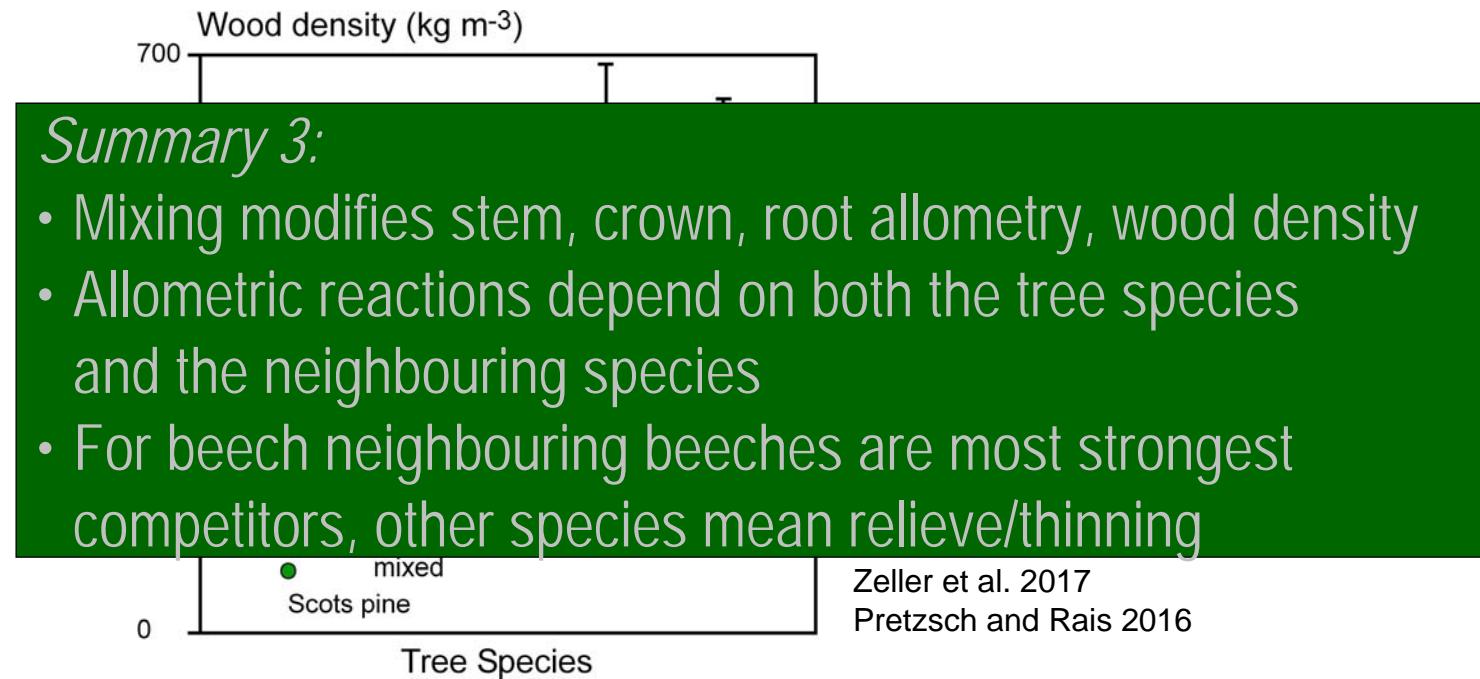

Wood density in mixed-species stands of S. pine and E. beech compared with monocultures

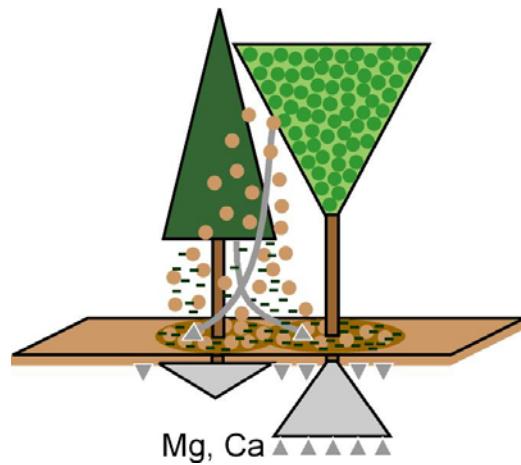

Zeller et al. 2017, Pretzsch and Rais 2016

Wood density in mixed-species stands of S. pine and E. beech compared with monocultures

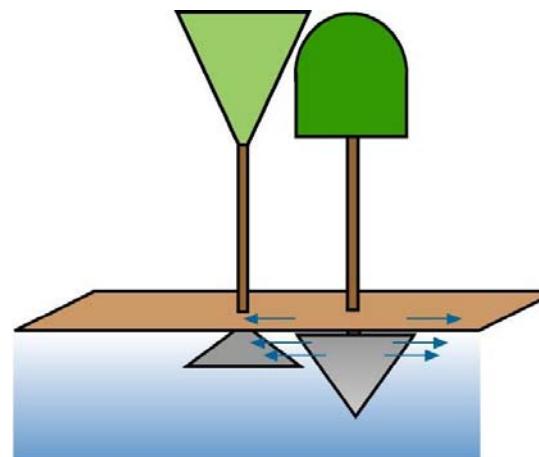

Facilitation by better mineral nutrients and water exploitation

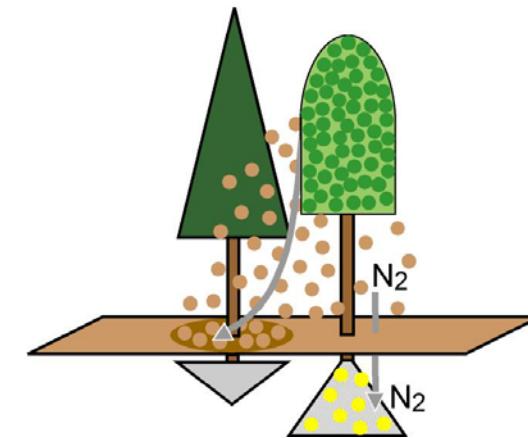

nutrients
upward transport

hydraulic
redistribution

atmospheric
 N_2 fixation

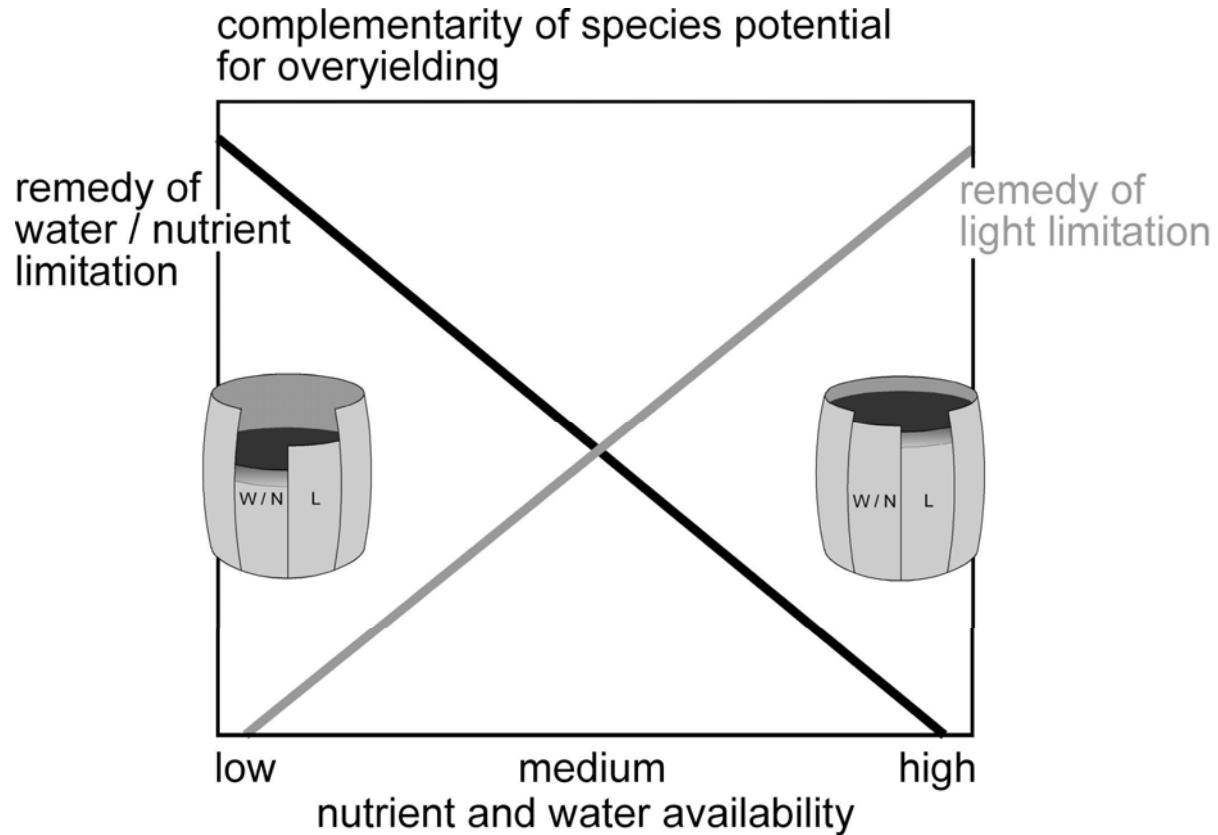

e.g. Rothe, Binkley (2001)

e.g. Prieto et al. 2012

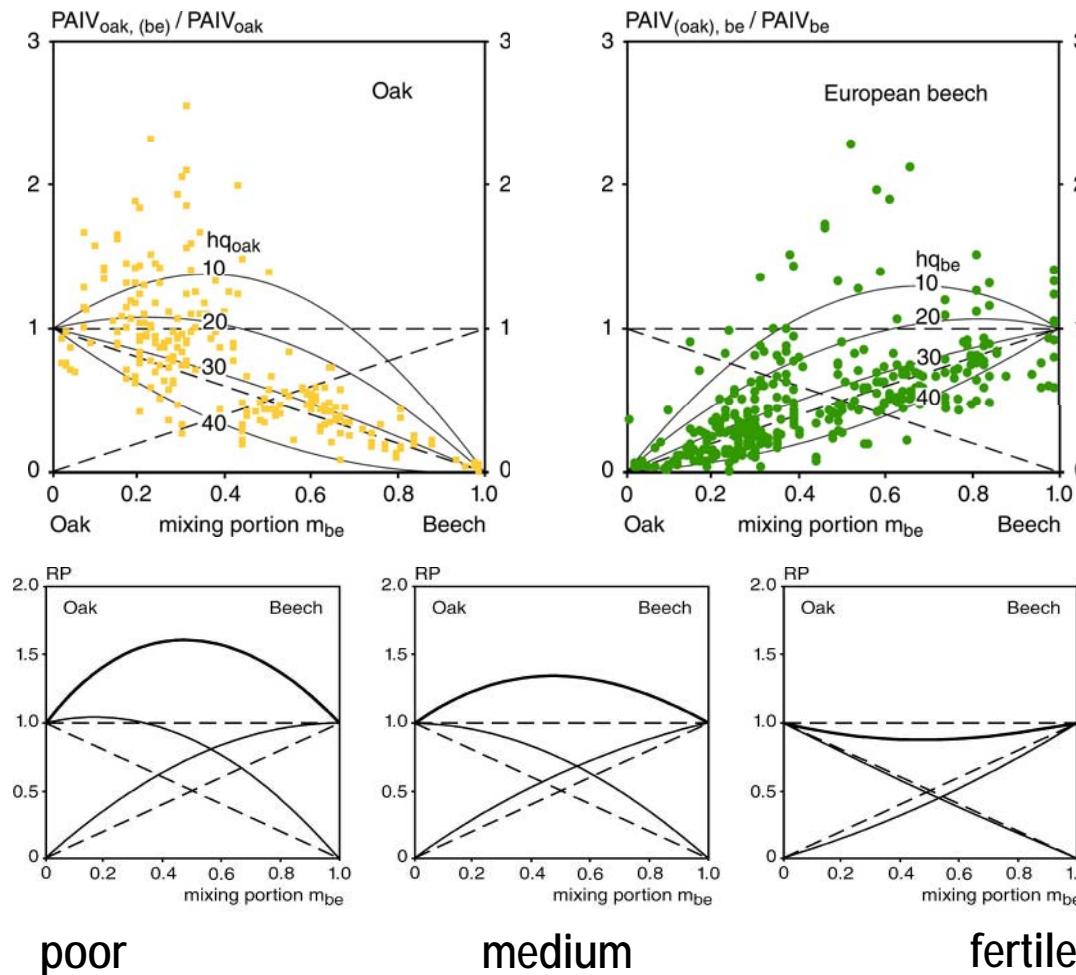

e.g. Forrester et al. 2007, 2007

Conceptual model for the dependency of overyielding on site conditions

e. g. Forrester (2017), Pretzsch (2017)

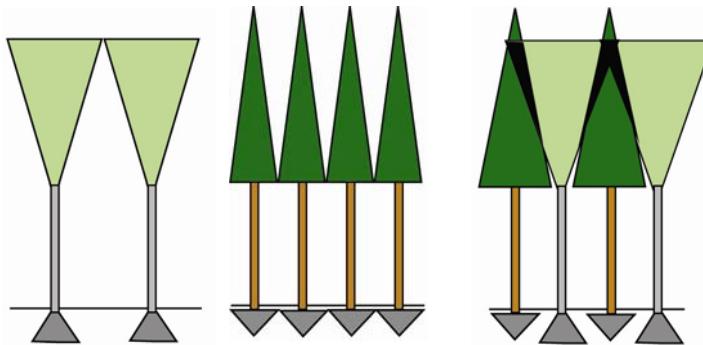

Transect study: Overyielding increases with water and nutrient scarcity

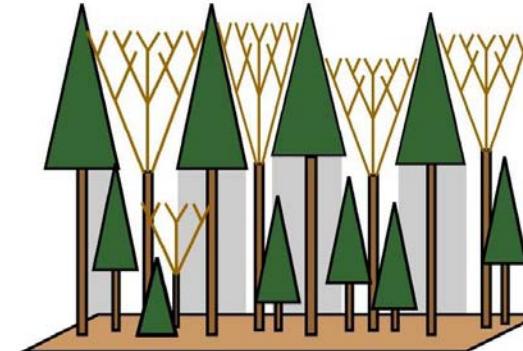

Pretzsch et al. (2013) Productivity of mixed versus pure stands of oak (*Quercus petraea* (Matt.) Liebl. and *Quercus robur* L.) and European beech (*Fagus sylvatica* L.) along an ecological gradient, EJFOR, 132 (2):263-280

Complementarity in light use causes competition reduction

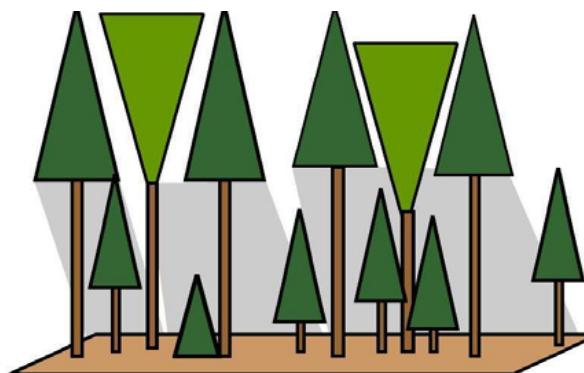

Morphological complementarity

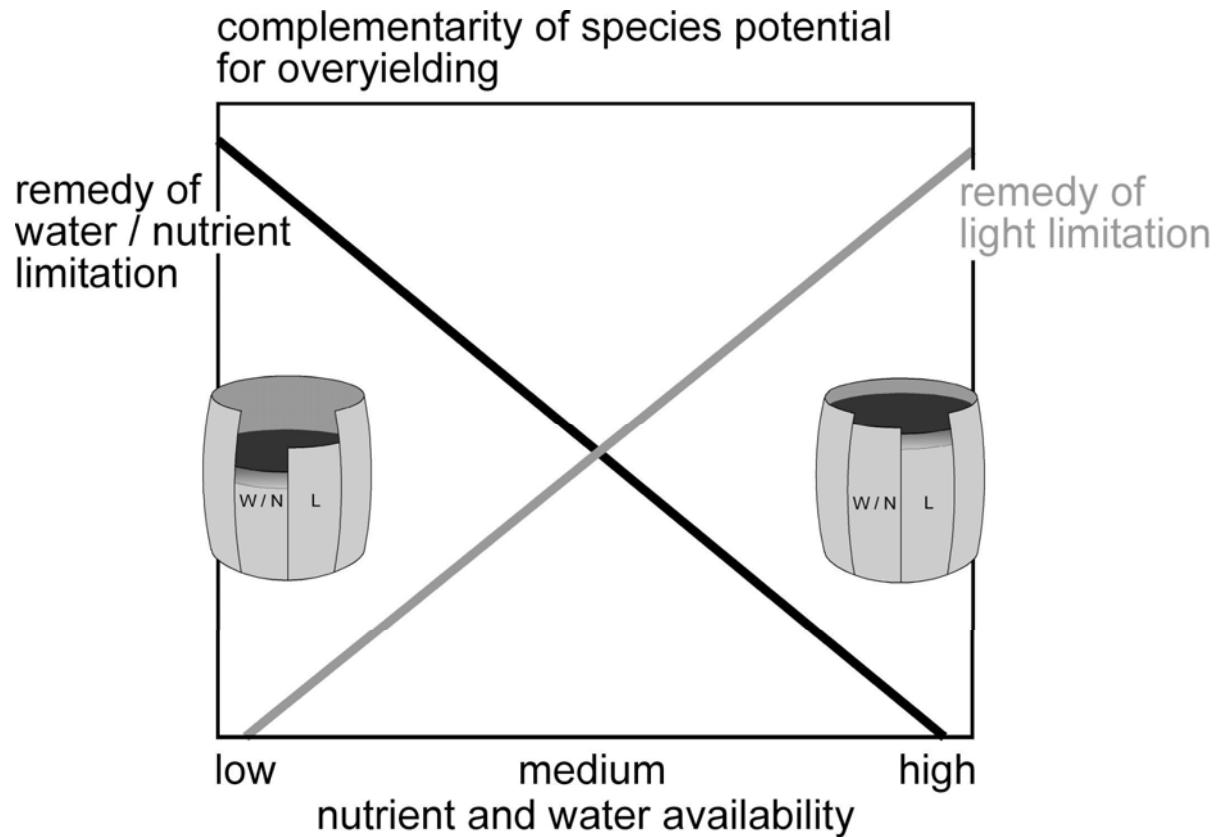

Temporal complementarity

Physiological complementarity

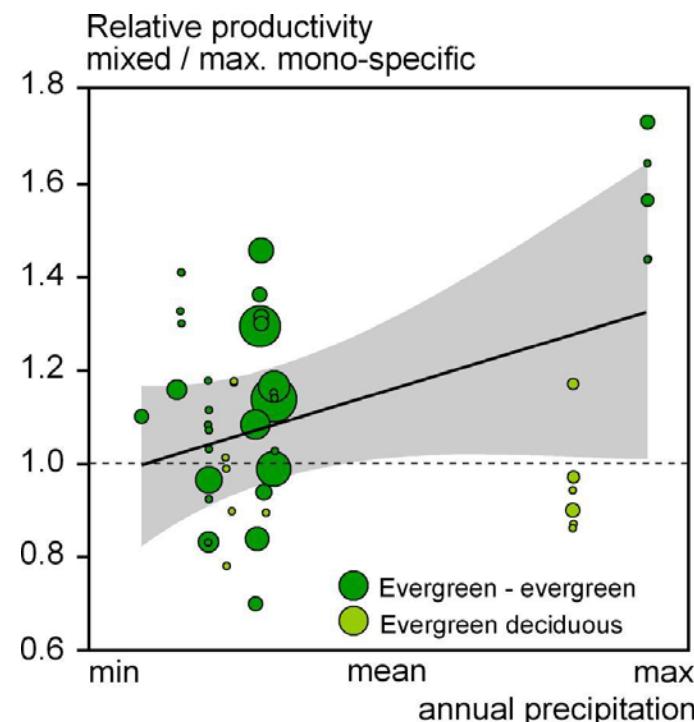

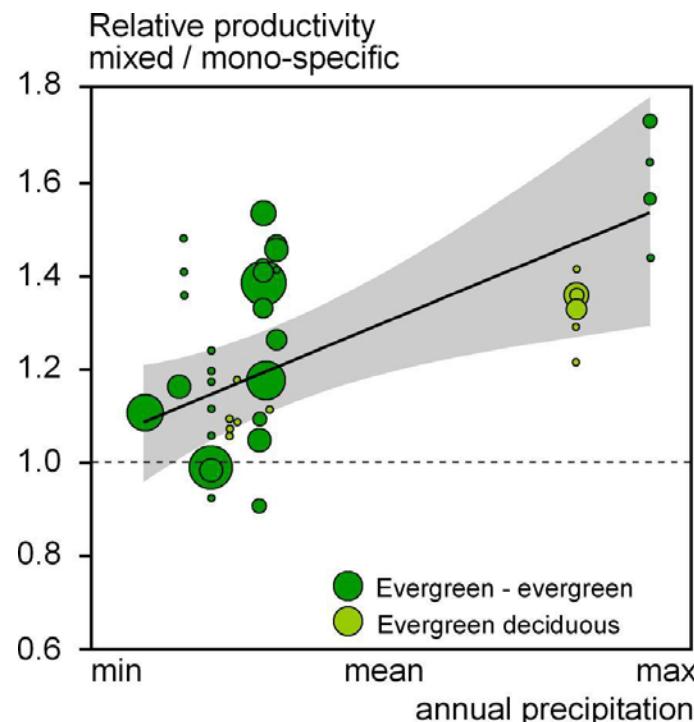

Conceptual model for the dependency of overyielding on site conditions

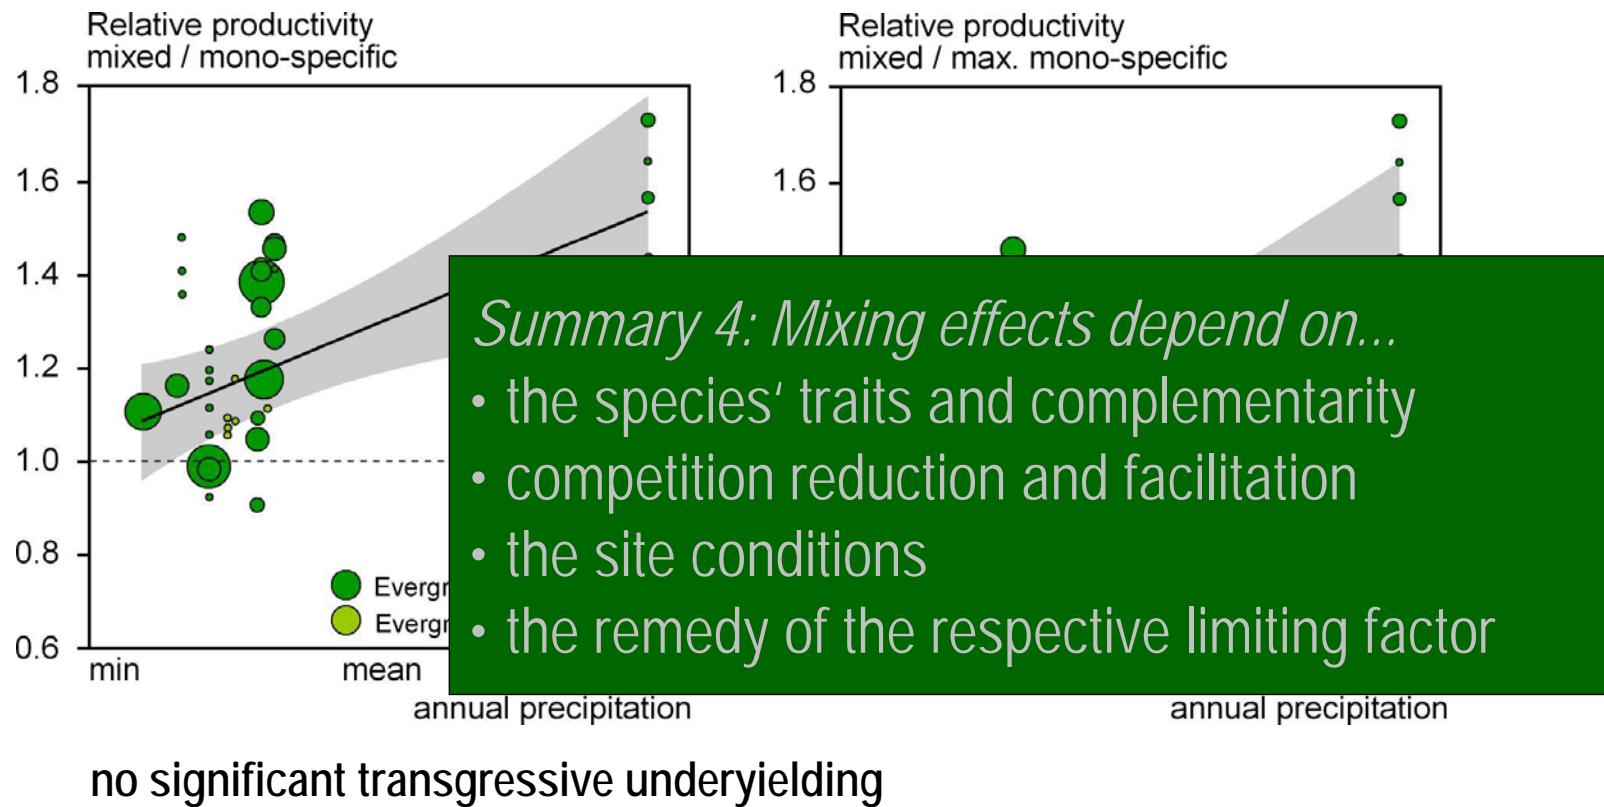

e. g. Forrester (2017), Pretzsch (2017)

Increasing overyielding (15 %) and transgressive overyielding with water availability

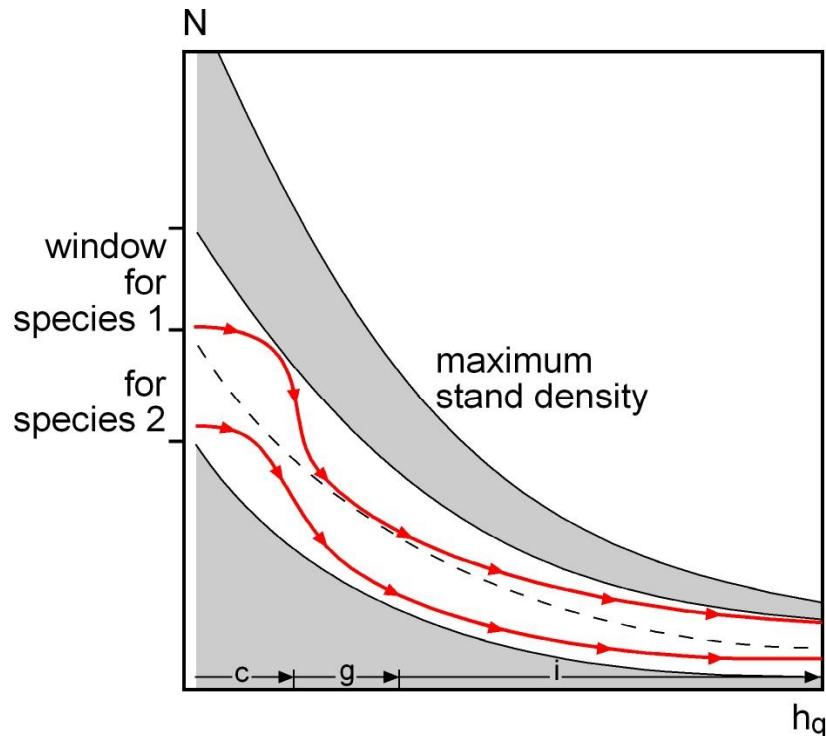

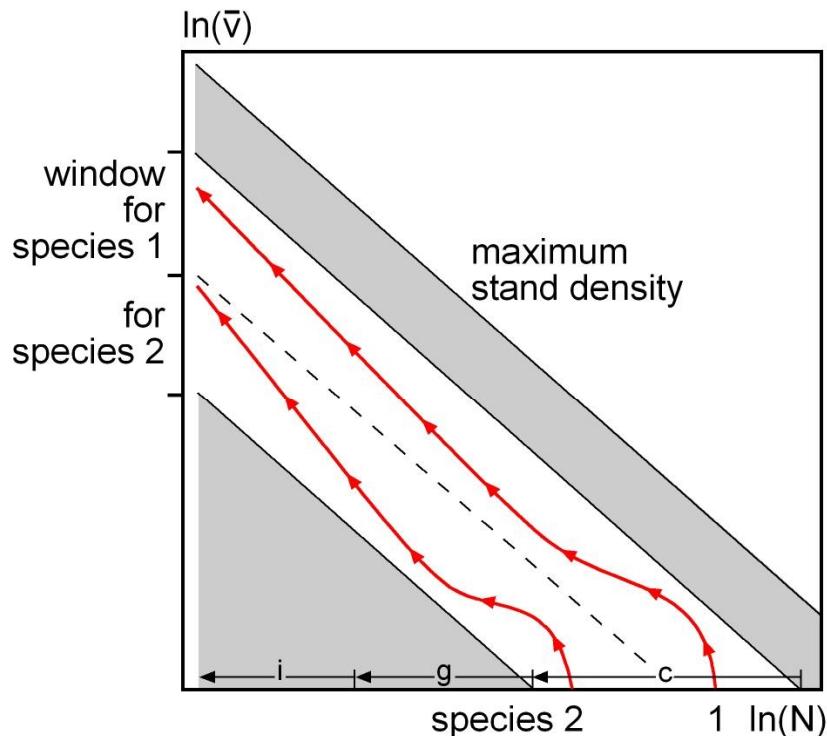

no significant transgressive underyielding

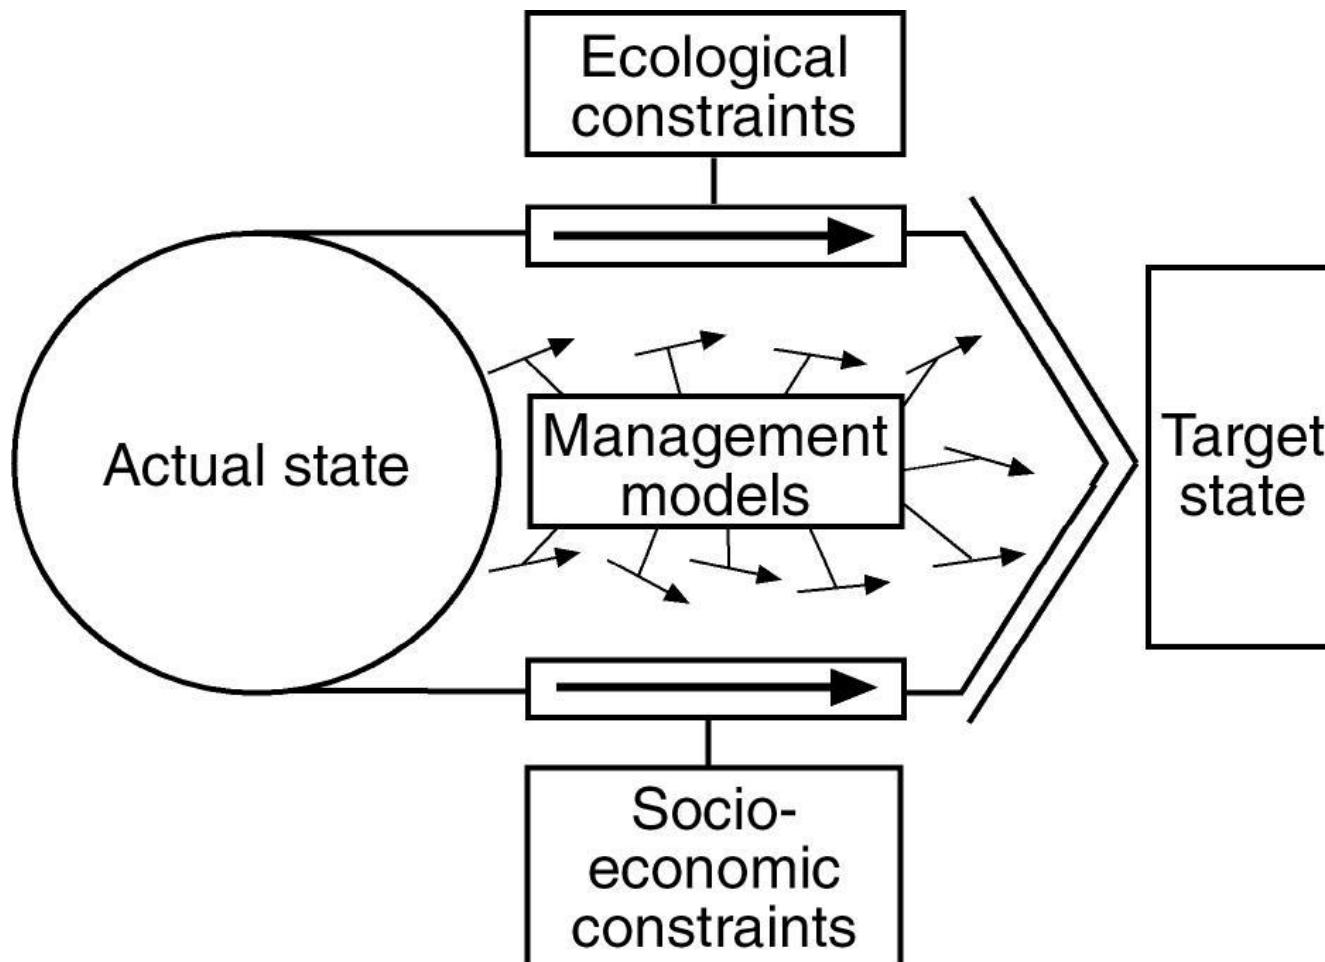

Increasing overyielding (15 %) and transgressive overyielding with water availability

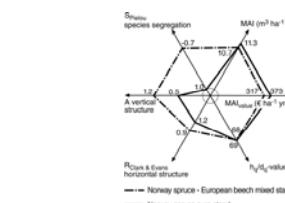

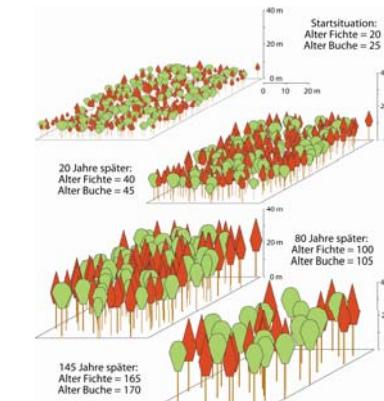

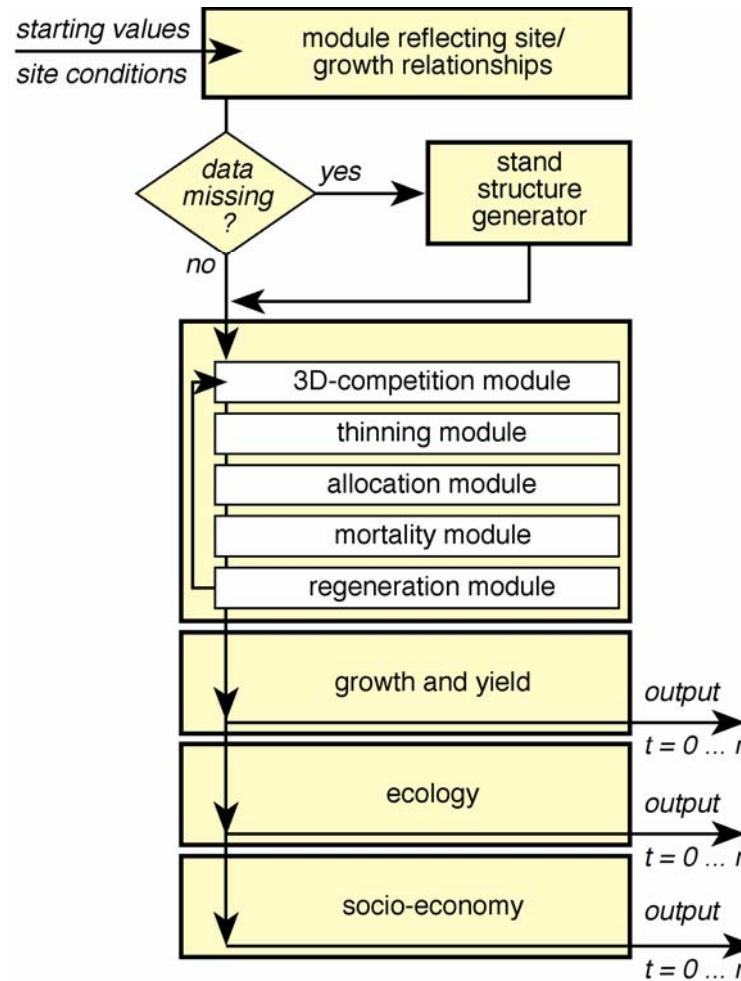

Guidelines for silvicultural regulation of mixed-species stand can bring the mixing idea onto the ground

Model application for deriving silvicultural guidelines

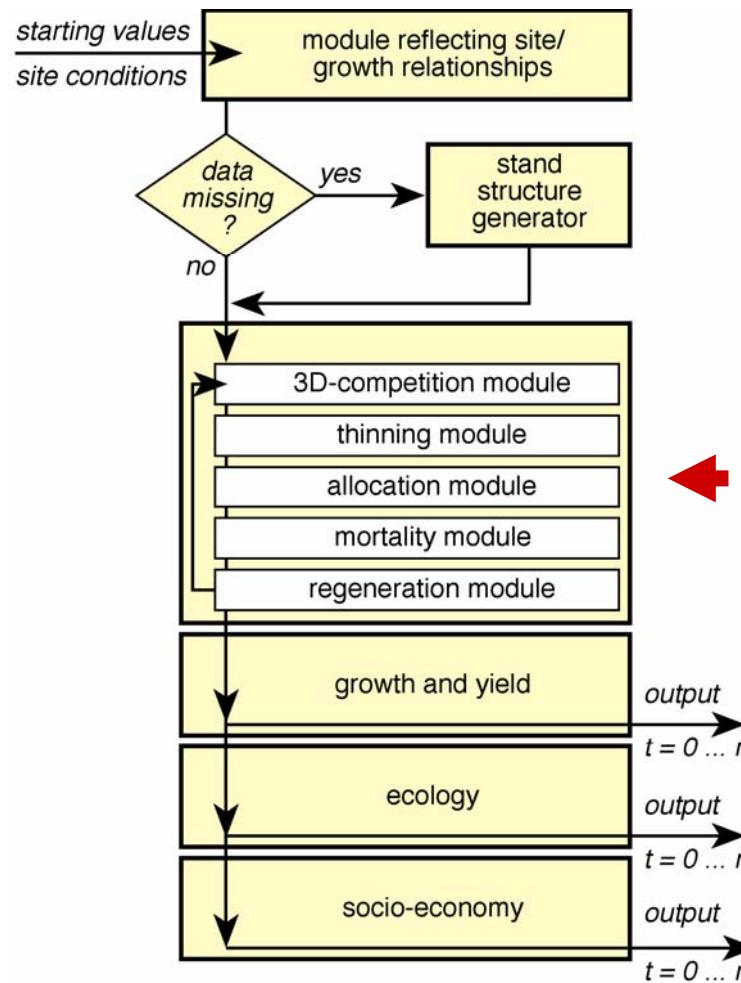

SILVA 3.0 as example of a spatially explicit individual tree model for pure and mixed stands

Pretzsch, H., Biber, P. und Dursky, J., 2002: The single tree based stand simulator SILVA. Construction, application and evaluation, Forest Ecology and Management, 162: 3-21

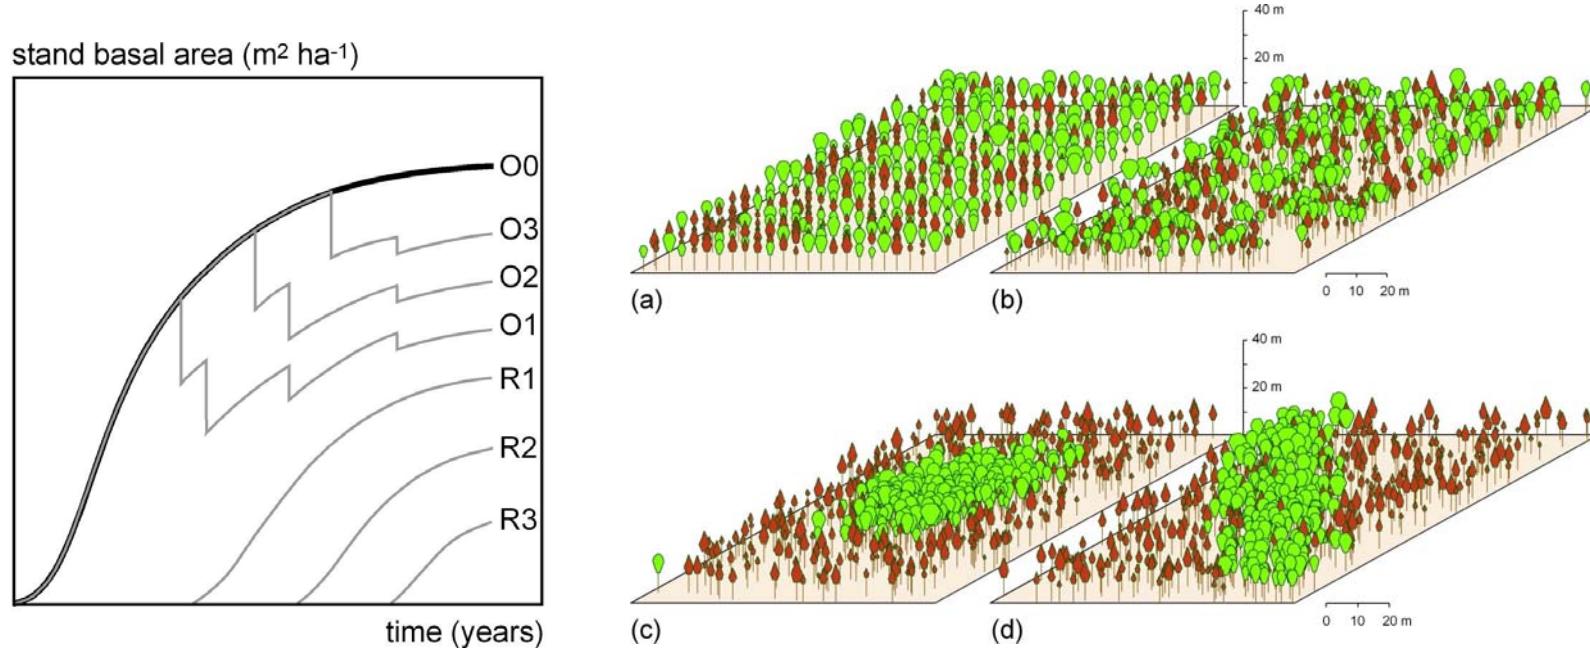

SILVA 3.0 as example of a spatially explicit individual tree model for pure and mixed stands

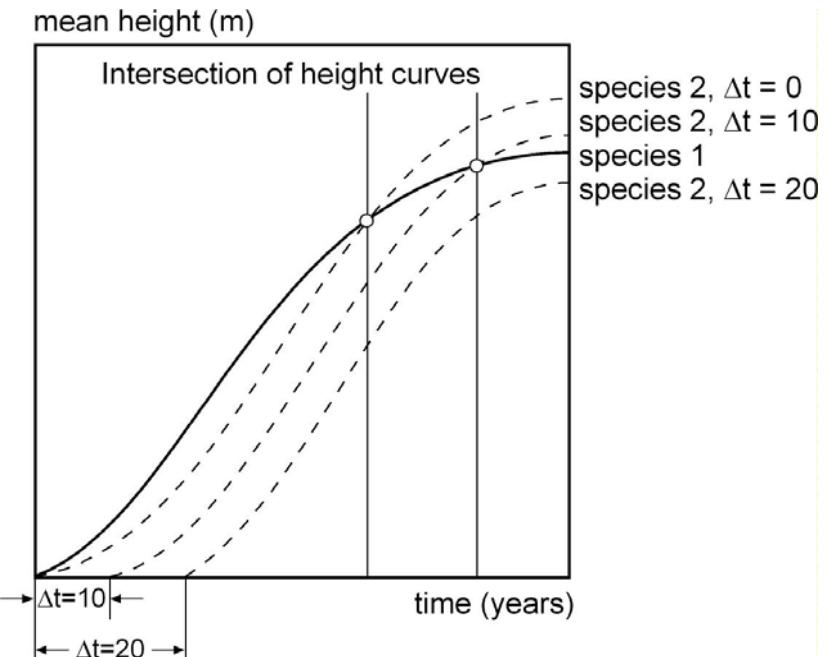

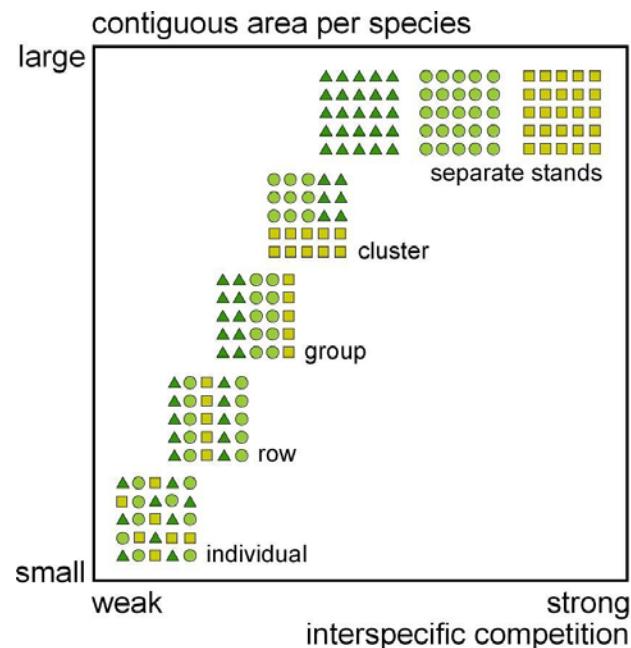

Integration of mixing effects on growth, structure, mortality

Extension of the algorithms for silvicultural regulation

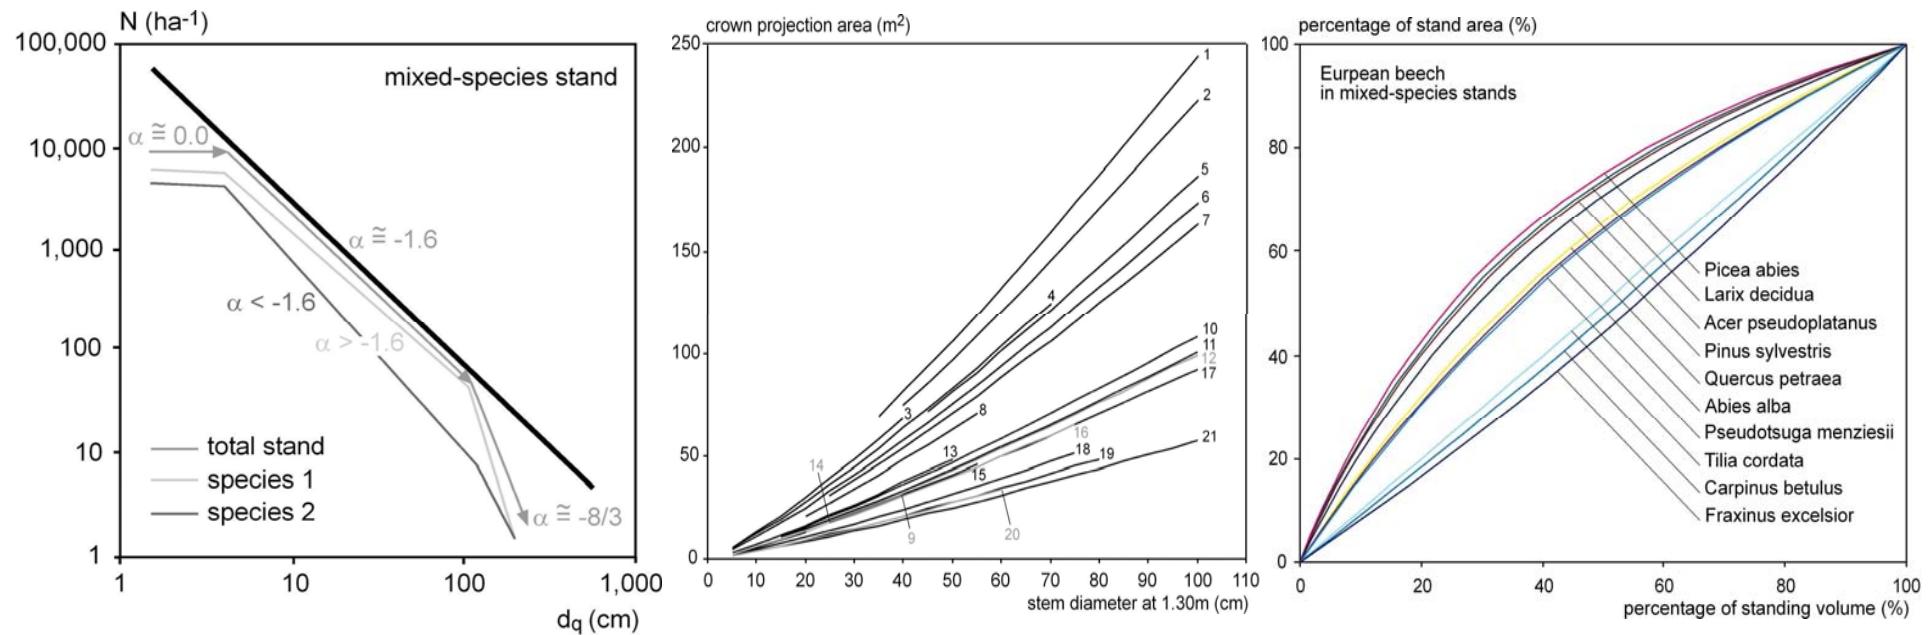

Rules and algorithms for initiating the regeneration depending on the density of the overstorey

Rules and algorithms for regulation of competition by spatial or temporal separation

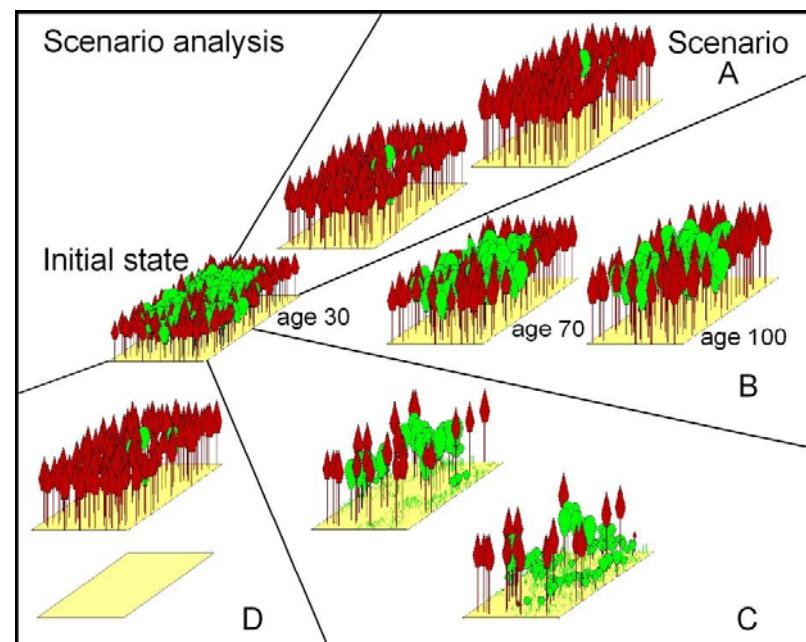

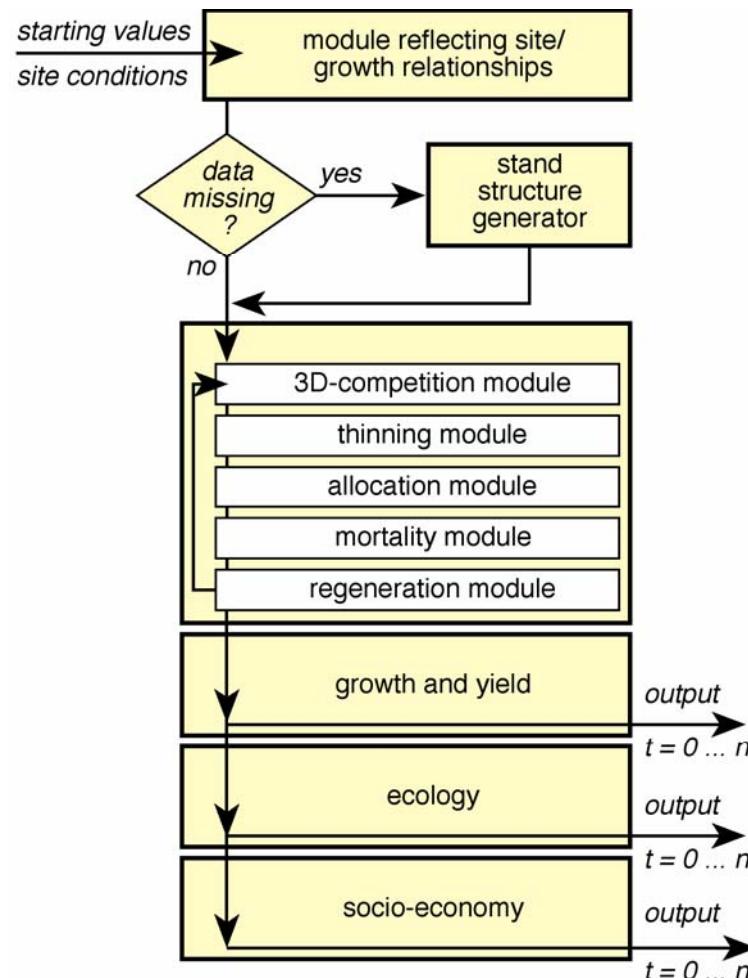

Rules and algorithms for regulation of stand density and species-specific mixing proportions

Pretzsch, H., Biber, P. und Dursky, J., 2002: The single tree based stand simulator SILVA. Construction, application and evaluation, Forest Ecology and Management, 162: 3-21

SILVA 3.0 as example of a spatially explicit individual tree model for pure and mixed stands

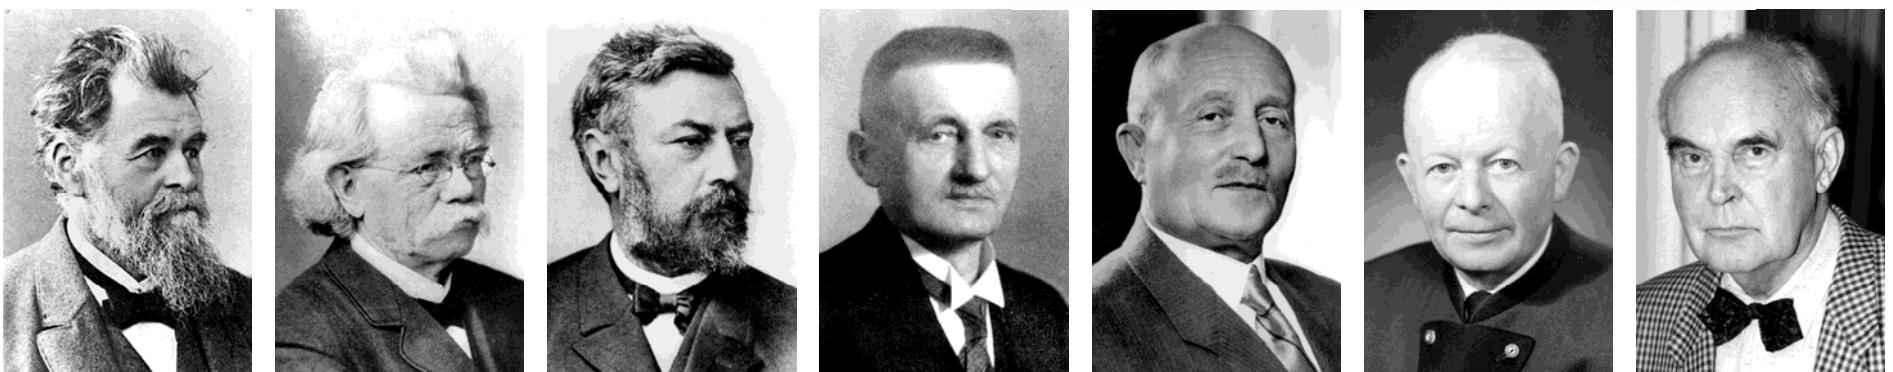

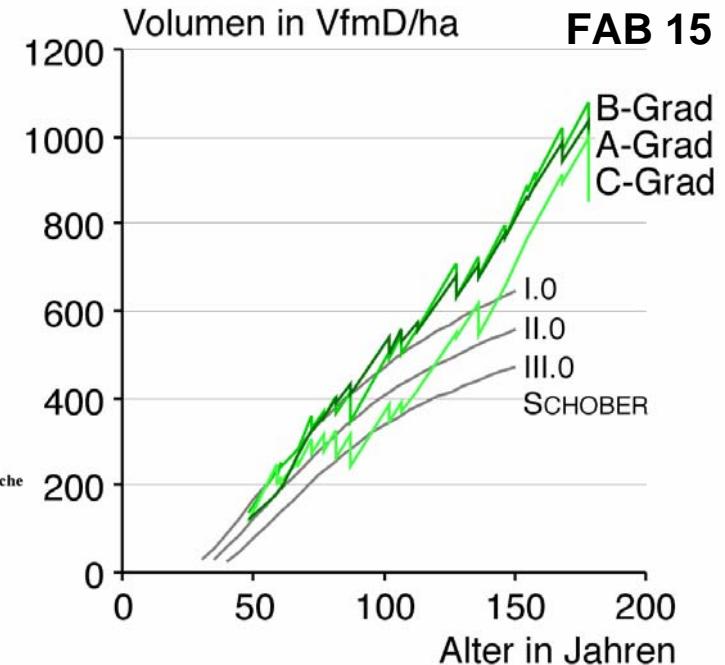

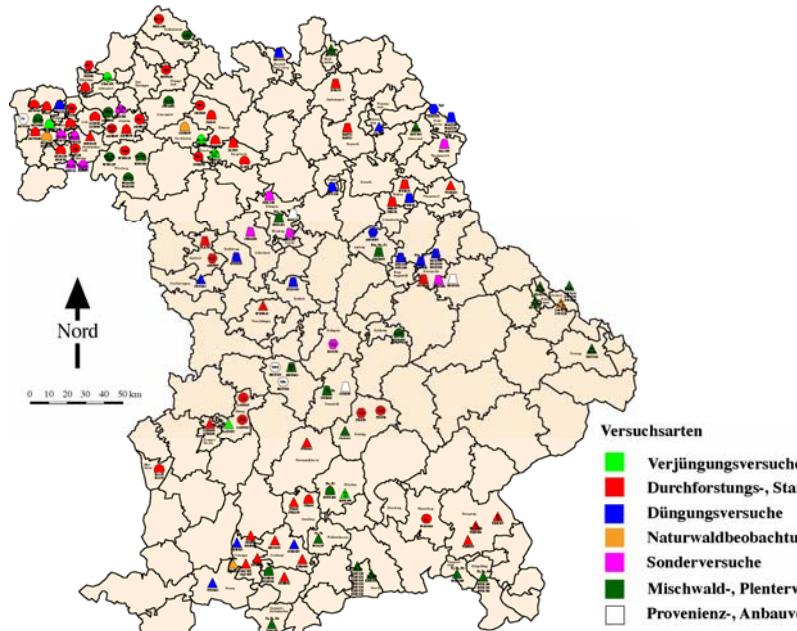

Summary 5: For bringing the mixed-species stand idea to the ground we need:

- silvicultural guidelines, models, scenario analyses
- integration of mixing effects in models
- rules and algorithms for regulating mixture in models
